5 Conclusion and perspectives

The PRIDE block cipher
The structure of PRIDE
1 of 19

## ■ The structure of PRIDE

Iterative block cipher composed of 20 rounds and introduced by Albrecht \& al. in 2014. It takes as input a 64 -bit block and uses a 128-bit key $k=k_{0} \| k_{1}$.

[^0]
## ■ The structure of PRIDE

Iterative block cipher composed of 20 rounds and introduced by Albrecht \& al. in 2014. It takes as input a 64 -bit block and uses a 128 -bit key $k=k_{0} \| k_{1}$.

## E The key scheduling

We denote $k_{1 i}$ the $i$-th byte of $k_{1}$ then

$$
f_{r}\left(k_{1}\right)=k_{1_{0}}\left\|g_{r}^{(0)}\left(k_{1_{1}}\right)\right\| k_{1_{2}}\left\|g_{r}^{(1)}\left(k_{1_{3}}\right)\right\| k_{1_{4}}\left\|g_{r}^{(2)}\left(k_{1_{5}}\right)\right\| k_{1_{6}} \| g_{r}^{(3)}\left(k_{1_{7}}\right)
$$

for round $r$ with

$$
g_{r}^{(i)}(x)=\left(x+C_{i} r\right) \bmod 256 \text { where } C_{i} \text { is a constant. }
$$

Differential properties of the PRIDE S-box
5 of 19

- Proposition

Let $\mathcal{S}$ be an n -bit S -box with differential uniformity 4. Let $\left(a_{1}, b_{1}\right)$ and ( $a_{2}, b_{2}$ ) be two differentials with $a_{1} \neq a_{2}$ such that the system of two equations

$$
\begin{align*}
& \mathcal{S}\left(x \oplus a_{1}\right) \oplus \mathcal{S}(x)=b_{1}  \tag{1}\\
& \mathcal{S}\left(x \oplus a_{2}\right) \oplus \mathcal{S}(x)=b_{2} \tag{2}
\end{align*}
$$

has at least two solutions. Then, each of the three equations (1), (2) and

$$
\begin{equation*}
\mathcal{S}\left(x \oplus a_{1} \oplus a_{2}\right) \oplus \mathcal{S}(x)=b_{1} \oplus b_{2} \tag{3}
\end{equation*}
$$

has at least four solutions.

## Differential Fault Analysis of PRIDE

Properties that make the attack effective
7 of 19

- The design of the linear layer
- Flip the 16 -bit output of one matrix after the $\mathcal{L}$-layer activates all S-boxes in the next round.

## Differential Fault Analysis of PRIDE

Properties that make the attack effective
7 of 19

- The design of the linear layer
- Flip the 16 -bit output of one matrix after the $\mathcal{L}$-layer activates all S-boxes in the next round.
- Use this property on the penultimate round allows the attacker to recover information on all nibbles of $k_{0}$.

## Differential Fault Analysis of PRIDE

Properties that make the attack effective
7 of 19

- The design of the linear layer
- Flip the 16 -bit output of one matrix after the $\mathcal{L}$-layer activates all S-boxes in the next round.
- Use this property on the penultimate round allows the attacker to recover information on all nibbles of $k_{0}$.
- The number of remaining candidates is at most $4^{16}$, where 4 is the differential-uniformity of the PRIDE S-box.

The differential properties of the S-box

## Differential Fault Analysis of PRIDE

Properties that make the attack effective

- The design of the linear layer
- Flip the 16 -bit output of one matrix after the $\mathcal{L}$-layer activates all S-boxes in the next round.
- Use this property on the penultimate round allows the attacker to recover information on all nibbles of $k_{0}$.
- The number of remaining candidates is at most $4^{16}$, where 4 is the differential-uniformity of the PRIDE S-box.
- The differential properties of the S-box
- The number of inputs which satisfy two valid differentials simultaneously is usually reduced to a single element.

## Differential Fault Analysis of PRIDE

Properties that make the attack effective

- The design of the linear layer
- Flip the 16 -bit output of one matrix after the $\mathcal{L}$-layer activates all S-boxes in the next round.
- Use this property on the penultimate round allows the attacker to recover information on all nibbles of $k_{0}$.
- The number of remaining candidates is at most $4^{16}$, where 4 is the differential-uniformity of the PRIDE S-box.
- The differential properties of the S-box
- The number of inputs which satisfy two valid differentials simultaneously is usually reduced to a single element.
- It is the case in each nibble for the presented strategies.

Exploitation of obtained faults
15 of 19

■ Calculating the value of $k$

- By intersecting sets for each nibble, we got 8 candidates for

$$
\mathcal{L}^{-1}\left(\mathcal{S}\left(\mathcal{P}^{-1}(C) \oplus k_{0}\right) \oplus \mathcal{P}^{-1}\left(f_{20}\left(k_{1}\right)\right)\right)
$$

we deduced 8 candidates for $\mathcal{P}^{-1}\left(f_{20}\left(k_{1}\right)\right)$.
Finally wie met 8 valune farl fan(tw) and on for $k$

$$
\mathcal{L}^{-1}\left(\mathcal{S}\left(\mathcal{P}^{-1}(C) \oplus k_{0}\right) \oplus \mathcal{P}^{-1}\left(f_{20}\left(k_{1}\right)\right)\right)
$$

- Then, we calculated the 8 possible $\mathcal{S}\left(\mathcal{P}^{-1}(C) \oplus k_{0}\right) \oplus \mathcal{P}^{-1}\left(f_{20}\left(k_{1}\right)\right)$, and from

$$
\mathcal{S}\left(\mathcal{P}^{-1}(C) \oplus k_{0}\right)=0 \times 128 \mathrm{bb} 20 f 824 \mathrm{eda} 39,
$$

we deduced 8 candidates for $\mathcal{P}^{-1}\left(f_{20}\left(k_{1}\right)\right)$.
Finally we got 8 values for $f_{20}\left(k_{1}\right)$ and so for $k_{1}$.
We eventually obtained, by testing all possible $k_{1}$, the secret

$$
k=0 \times f 3 f 721 \mathrm{cb1c} 882658 \mathrm{e} 417 \mathrm{~d} 148 \mathrm{e} 239 \mathrm{ca5c}
$$

## Conclusion and perspectives

- The structure of PRIDE
- The PRIDE round functionDifferential Fault Analysis of PRIDE
- General principle
- Differential properties of the PRIDE S-box
- Properties that make the attack effective
(5) nactical thmtemetitation oftemra ofn mniDE
- Implementation of the device
- Exploitation of obtained faults
- Duplication of computations
- Desynchronization
- Masking
(5) Conclusion and perspectives

# Conclusion and perspectives 

- Conclusion
- First DFA on PRIDE with 4 faults only to retrieve the full secret key.
> electromagnetic injection, which is a low-cost means of injection
> Resistance against DFA is important for a cipher like PRIDE, which will be dedicated to low-end devices thanks to its lightness. Some countermeasures which leave the cipher still efficient for lo $T$ devices.

Perspectives

# Conclusion and perspectives 

- Conclusion
- First DFA on PRIDE with 4 faults only to retrieve the full secret key.
- Practical implementation from 32-bit random faults obtained with electromagnetic injection, which is a low-cost means of injection.
$\qquad$

Perspectives

Conclusion and perspectives

- Conclusion
- First DFA on PRIDE with 4 faults only to retrieve the full secret key.
- Practical implementation from 32-bit random faults obtained with electromagnetic injection, which is a low-cost means of injection.
- Resistance against DFA is important for a cipher like PRIDE, which will be dedicated to low-end devices thanks to its lightness.
- Some countermeasures which leave the cipher still efficient for loT devices.

■ Perspectives

- Optimize countermeasures to make them less costly and keep the light side of PRIDE : be careful that the protections do not open doors to further attacks.

Conclusion and perspectives

- Conclusion
- First DFA on PRIDE with 4 faults only to retrieve the full secret key.
- Practical implementation from 32-bit random faults obtained with electromagnetic injection, which is a low-cost means of injection.
- Resistance against DFA is important for a cipher like PRIDE, which will be dedicated to low-end devices thanks to its lightness.
- Some countermeasures which leave the cipher still efficient for loT devices.

## Perspectives

- Optimize countermeasures to make them less costly and keep the light side of PRIDE : be careful that the protections do not open doors to further attacks.
- Apply our attack to SPN-based block ciphers with a linear layer similar to the one used in PRIDE like the LS-Designs family : will be studied in a future work.
