HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Catalytic Reduction and Conversion of Small Molecules (CO₂, SO₂, N₂O)

Lucile Anthore-Dalio, Thibault Cantat

NIMBE, CEA, CNRS, Université Paris-Saclay, 91191 Gif-sur-Yvette, France.

Most of our chemical commodities relies on non-renewable resources and in particular on the oxidation of hydrocarbons. The need to find novel and renewable feedstocks for the production of both bulk and fine chemicals have led the chemical community to consider starting materials of high oxidation states such as CO₂ or biomass. In this context, reductive strategies to convert these in valuable chemicals have emerged.

Over the last years, our group has intensively worked on the development of catalytic systems to reduce C–O and C=O bonds, allowing the reductive functionalization of CO₂ in a so-called diagonal approach,¹ as well as the recycling of oxygenated polymers.² Thus, reactions involving mild reducing agents such as silanes or boranes in presence of organo- or organometallic catalysts have been developed.³ Recent extensions of this methodology also enabled the reduction of other oxygenated compounds, with the direct synthesis of sulfones from SO₂⁴ and the reduction of N₂O.⁵
