HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Modelling of membrane and comparison in the case of pertraction experiments

Pertraction principle

Liquid-liquid extraction across hollow fibers (membrane)

Interfacial area determined by the geometry of the device

No emulsion is generated

► Advantages

- No need for density difference between phases
- No problem of phase emulsification
- Well defined geometry: easy scale-up
- Co or counter-current configuration

► Drawbacks

- Generally lower mass transfer flux compared to classical extraction devices (mixers-settlers, agitated columns, centrifuge extractors)
- Pressure in each phase must be well control to avoid phase entrainments

$$\Delta P < \frac{2\gamma \cos\theta}{r}$$

- Risk of clogging

Pertraction experimental setup

Extraction of Nd in co-current closed loop on solvent with HDEHP 0.5M

Online measurement of neodymium concentration in the output organic phase by spectrophotometry at $\lambda = 584 \text{ nm}$

Characteristics of the membrane:

Material: Polypropylene

Pores size: $200 \mu\text{m}$

Porosity: 72%

Tortuosity: ~ 2

Thickness: $400 \mu\text{m}$

Manufacturer: Microdyn-Nadir

Evolution of Nd concentration in the outlet solvent

Modelling of extraction through a cylindrical hollow fiber (1/2)

Laminar flow ($Re < 1$) $\rightarrow$ axisymmetric Hagen-Poiseuille flow

$$u(r) = \frac{2Q_{org}}{\pi r_{int}^2} \left(1 - \left(\frac{r}{r_{int}} \right)^2 \right) \quad \text{inside the fiber}$$

$$u(r) = \frac{2Q_{aq}}{\pi} \frac{(r_{cal}^2 - r^2) + (r_{cal}^2 - r_{ext}^2) \frac{\ln\left(\frac{r}{r_{cal}}\right)}{\ln\left(\frac{r_{cal}}{r_{ext}}\right)}}{\left((r_{cal}^4 - r_{ext}^4) - \frac{(r_{cal}^2 - r_{ext}^2)^2}{\ln\left(\frac{r_{cal}}{r_{ext}}\right)} \right)} \quad \text{outside the fiber}$$

- General transport equation of a solute in each phase

$$\frac{\partial C(r, z, t)}{\partial t} = -u(r, z) \frac{\partial C(r, z, t)}{\partial z} + D \left(\frac{\partial}{\partial z} \left(\frac{\partial C(r, z, t)}{\partial z} \right) + \frac{\partial}{\partial r} \left(\frac{\partial C(r, z, t)}{\partial r} \right) + \frac{1}{r} \frac{\partial C(r, z, t)}{\partial r} \right)$$

negligible

$$D = D_{aq} \quad \text{in the aqueous channel}$$

$$D = D_{org} \quad \text{in the organic channel}$$

$$D = D_{mem} = \frac{D_{org} \varepsilon}{\tau} \quad \text{in the hydrophobic membrane (i.e. filled with organic phase)}$$

- Kinetics of transfer at the interphase between the aqueous phase and the organic phase

$$\emptyset = \varepsilon k_v \left(C_{aq,i} - \frac{C_{org,i}}{K_d} \right) \quad \text{mass transfer flux at the interphase}$$

- Constant or variable distribution coefficient $K_d = \frac{C_{org,eq}}{C_{aq,eq}}$
- Discretization of equations with finite differences scheme and resolution of the matrix system with a time implicit scheme using Scilab software
- Transient calculation performed until equilibrium is reached

Calculation of the mass transfer coefficients from concentration profiles

Determination of the influence of the different terms in the resistance to mass transfer

$$\phi = K_{aq} \left(C_{aq} - \frac{C_{org}}{K_d} \right) = k_{aq} (C_{aq} - C_{aq,i}) = D_{aq} \left(\frac{\partial C_{aq}}{\partial r} \right)_i$$

$$\phi = K_{org} (K_d C_{aq} - C_{org}) = k_{org} (C_{org,s} - C_{org}) = D_{org} \left(\frac{\partial C_{org}}{\partial r} \right)_s$$

$$\phi = \varepsilon k_v \left(C_{aq,i} - \frac{C_{org,i}}{K_d} \right) = \frac{\varepsilon D_{org}}{e_m \tau} (C_{org,i} - C_{org,s})$$

$$\frac{1}{K_{org}} = \frac{1}{k_{org}} + \frac{e_m \tau}{\varepsilon D_{org}} + \frac{K_d}{\varepsilon k_v} + \frac{K_d}{k_{aq}}$$

resistance in organic phase

membrane resistance

interfacial resistance

resistance in aqueous phase

Variation of distribution coefficient of Neodymium Kd

SAXS spectra of the third phase crystalline phase

Set of parameters

- $D_{aq} = 5.8 \cdot 10^{-10} \text{ m}^2 \cdot \text{s}^{-1}$ (experimental value*)
- $D_{org} = 10.6 \cdot 10^{-11} \text{ m}^2 \cdot \text{s}^{-1}$ (derived from experimental value* for [HDEHP] = 1 M and corrected for [HDEHP] = 0.5 M according to the variation of the viscosity)
- Porosity = 72% (Mercury porosimeter)
- Tortuosity = 2.6 Value adjusted to fit all the data (manufacturer's data ~ 2)

* Etude des conditions de mise en œuvre de la pertraction pour l'extraction de métaux d'intérêt, Moussa Touré, PhD Thesis, Montpellier University, 2015

Nd concentration in the output organic phase (simulations/experiment)

Blocking of the diffusion in the third phase layer must be taken into account to fit with experimental data.

Zoom inside the membrane

Comparison of experimental data versus simulation

Run n° 22 $[\text{Nd}]_{\text{aq}} = 0.1 \text{ g L}^{-1}$
 $A = 101.7 \text{ mL h}^{-1}$ $O = 10.7 \text{ mL h}^{-1}$

Run n° 19 $[\text{Nd}]_{\text{aq}} = 0.25 \text{ g L}^{-1}$
 $A = 99.2 \text{ mL h}^{-1}$ $O = 10.1 \text{ mL h}^{-1}$

Run n°18 $[\text{Nd}]_{\text{aq}} = 0.5 \text{ g L}^{-1}$
 $A = 98.3 \text{ mL h}^{-1}$ $O = 9.9 \text{ mL h}^{-1}$

Run n° 11 $[\text{Nd}]_{\text{aq}} = 1 \text{ g L}^{-1}$
 $A = 100 \text{ mL h}^{-1}$ $O = 10 \text{ mL h}^{-1}$

Run n° 21 $[\text{Nd}]_{\text{aq}} = 1.5 \text{ g L}^{-1}$
 $A = 97 \text{ mL h}^{-1}$ $O = 10.9 \text{ mL h}^{-1}$

■ Res_aq ■ Res_interf ■ Res_mem ■ Res_org

Evolution of resistance to mass transfer

Resistance to mass transfer increase in the membrane with Nd concentration because of the decrease of the distribution coefficient (lower gradient concentration in the solvent) and appearance of the third phase.

- ▶ **Good agreement between experiments and simulation of neodymium pertraction with HDEHP**
 - No correlation needed for mass transfer coefficients
 - Modelling of the blocking of the diffusion in the membrane due to third phase formation fit well with experiments
 - The model can be used to design and scale-up pertraction process

- ▶ **More investigations should be done about the third phase layer:**
 - Can it be used to increase separation efficiency with other ions?
 - How can mass transfer be increased using ultrasonic external triggering?
