Submitted on 10 Jan 2020

**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

DE LA RECHERCHE À L'INDUSTRIE

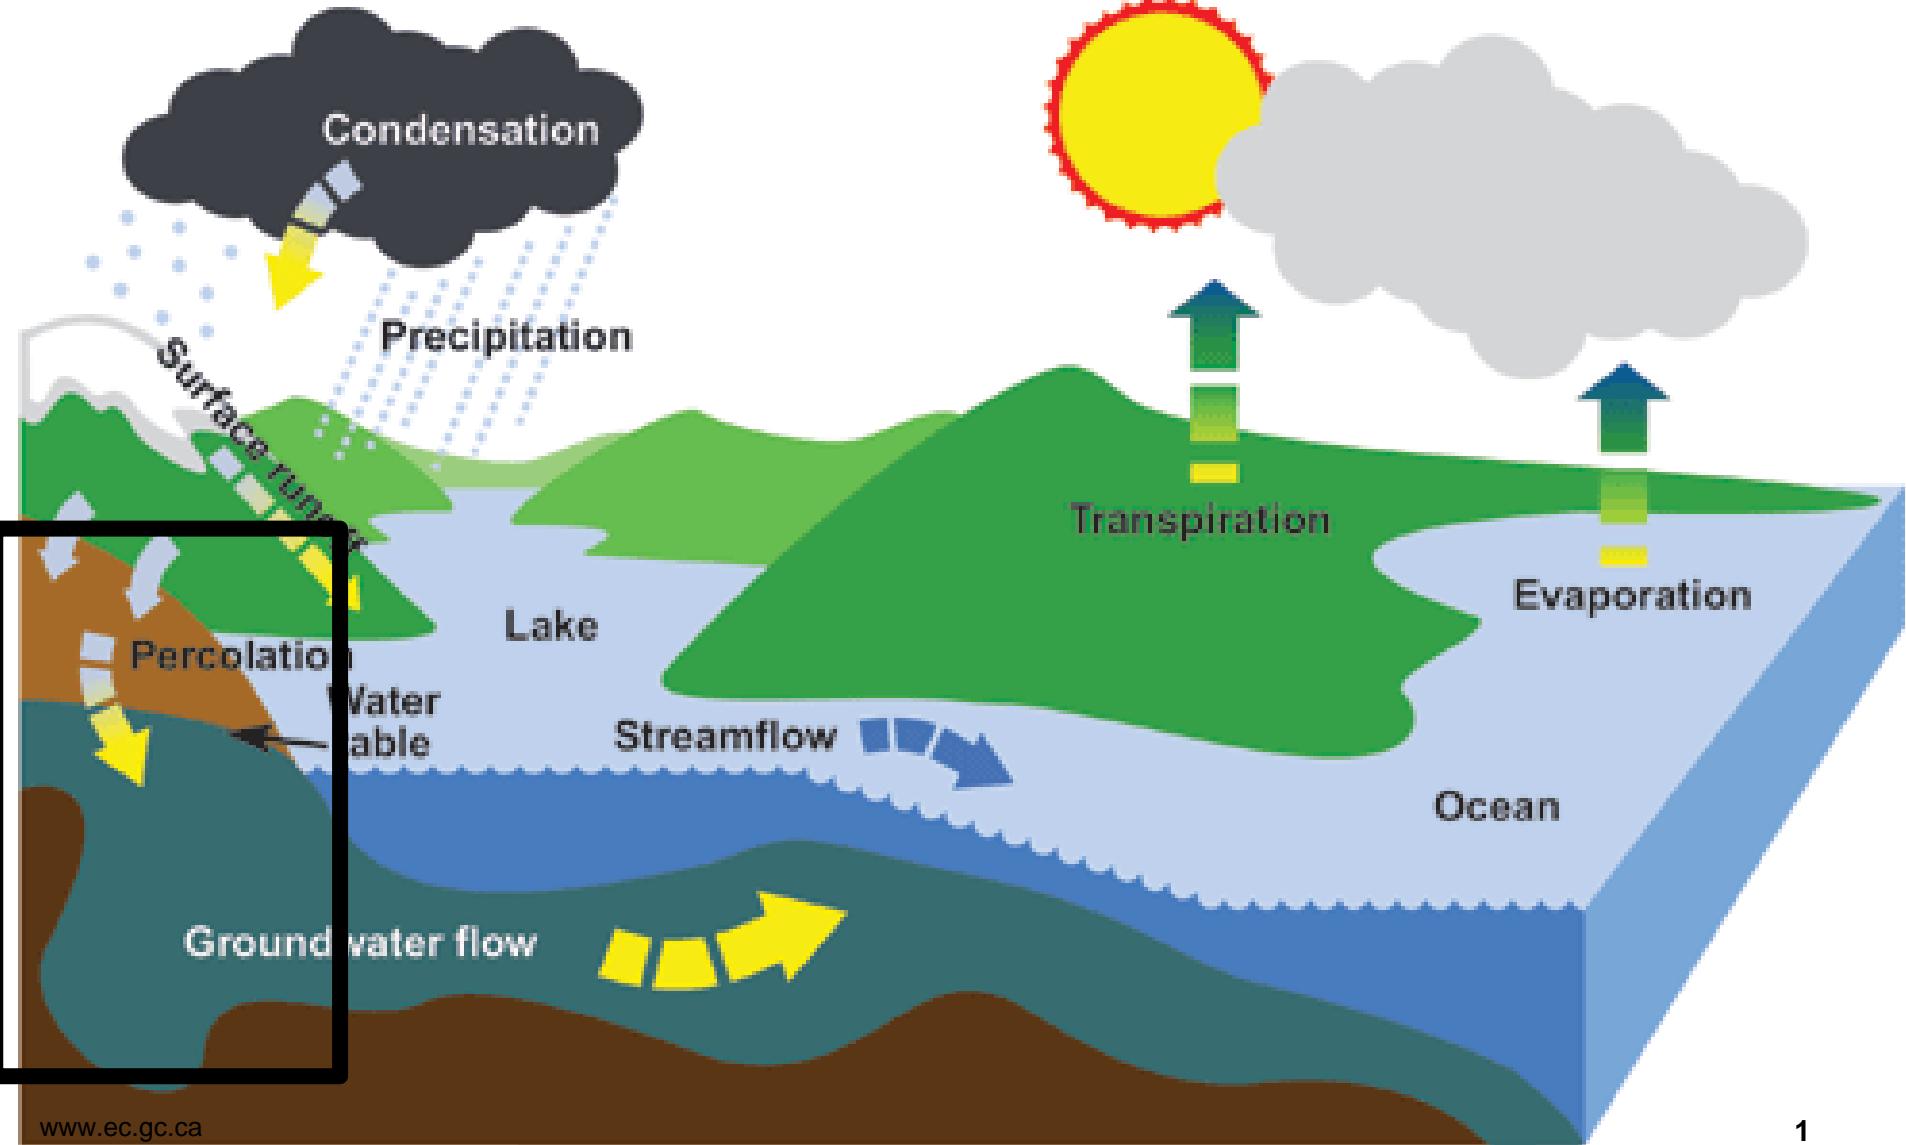

# **SIMULTANEOUS ESTIMATION OF GROUNDWATER RECHARGE AND HYDRODYNAMIC PARAMETERS FOR GROUNDWATER FLOW MODELING**

Fadji HASSANE MAINA (Université de Strasbourg)  
Philippe ACKERER (Université de Strasbourg)  
Olivier BILDSTEIN (CEA Cadarache)

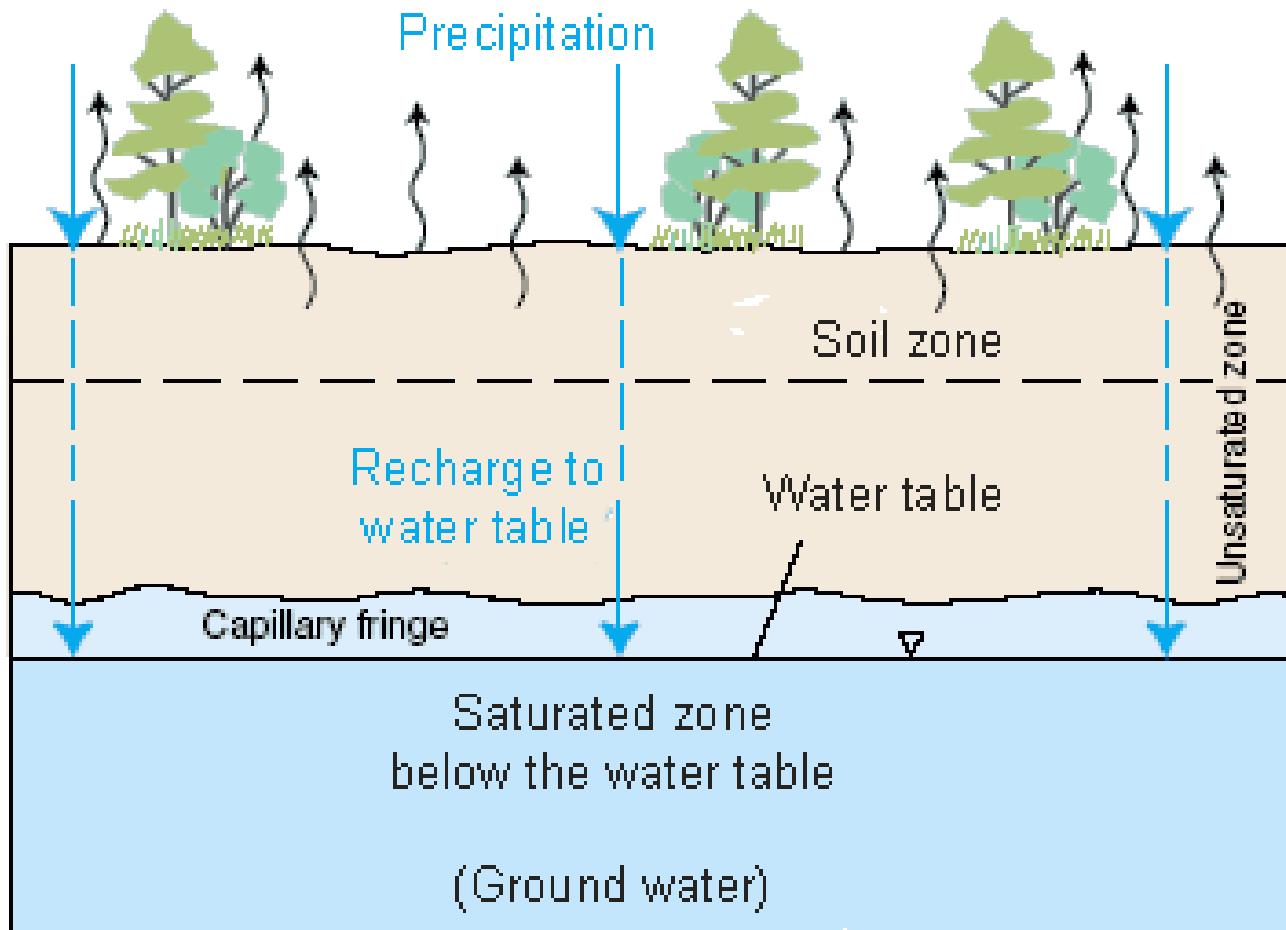

# INTRODUCTION

## The hydrologic cycle

# INTRODUCTION

- **Groundwater (aquifers):** 3<sup>rd</sup> freshwater reservoir on the planet
- Replenished essentially by precipitation through **groundwater recharge**

# INTRODUCTION

- **Groundwater (aquifers):** 3<sup>rd</sup> freshwater reservoir on the planet
- Replenished essentially by precipitation through **groundwater recharge**
- The **main available water resources** for many countries
- Threatened by pollution and over-exploited
- Usually described by models  Simulations of piezometric levels (Hydraulic heads)
- **Physical Models are widely used**

1. **Continuity equation** (mass conservation):  $S \frac{\partial H}{\partial t} + \nabla \cdot q = q_s$

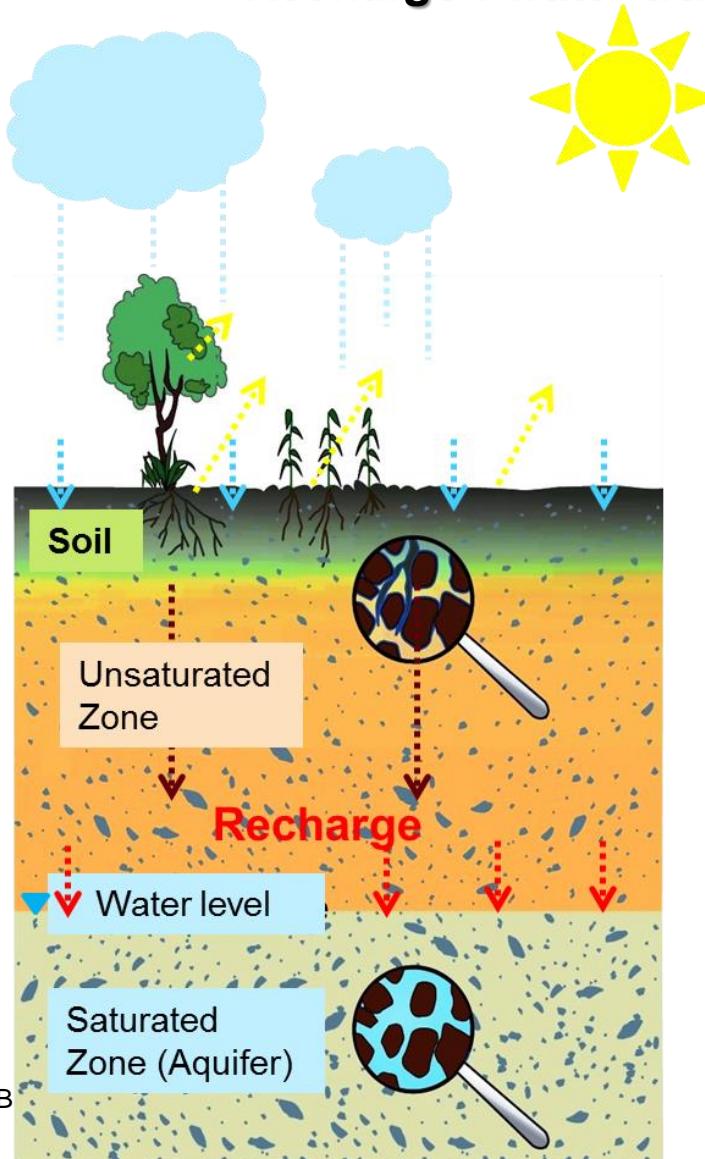

2. **Darcy's law** (computation of fluxes):  $q = -K \nabla H$

**Diffusivity equation** (flow equation):  $S \frac{\partial H}{\partial t} - \nabla \cdot [K \nabla H] = q_s$

**Values of H knowing S, K and  $q_s$  → S and K are constant,  $q_s$  includes groundwater recharge**

# GROUNDWATER RECHARGE

## Recharge : water transfer from precipitation to groundwater

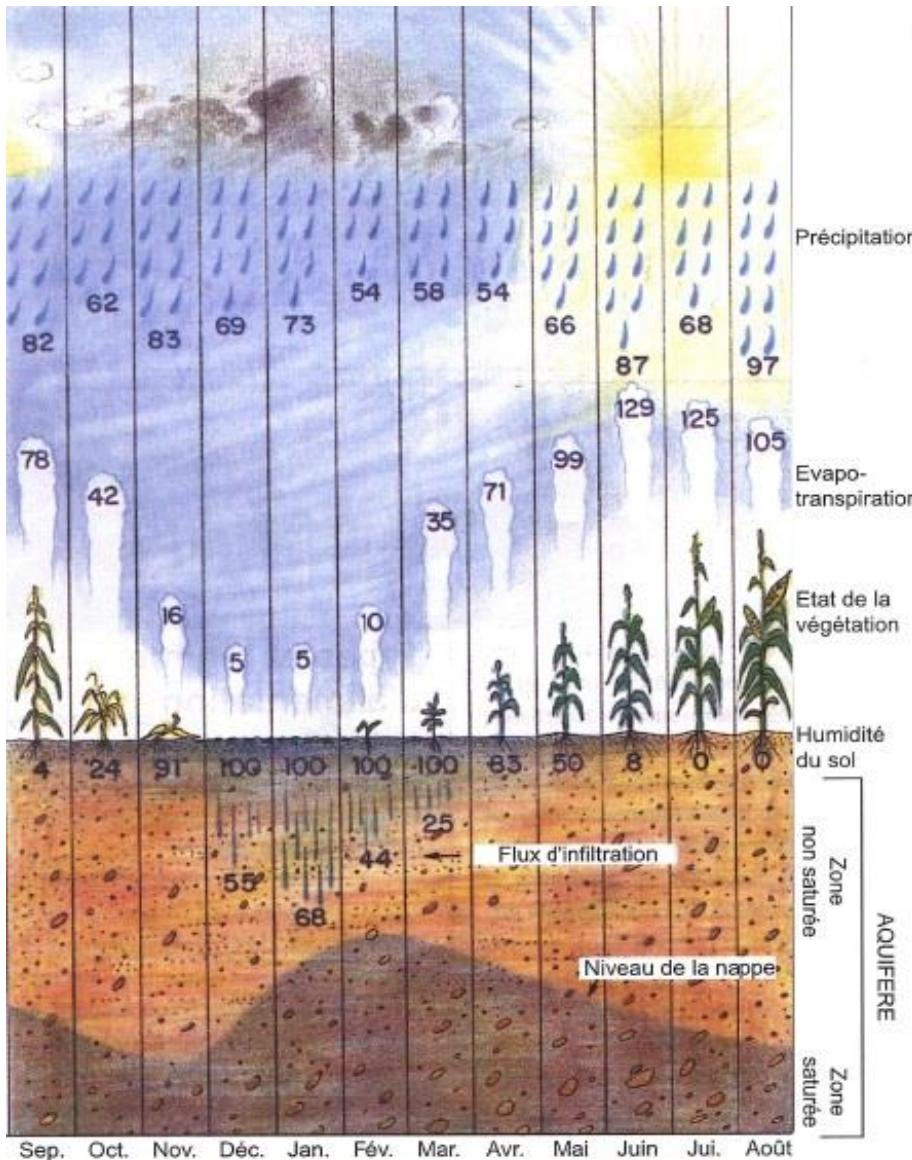

- 😊 Groundwater flow models: **Sophisticated and accurate**
- 😢 Recharge modeling: **Challenge**
  - Complex hydrological component

**Groundwater recharge depends on:**

- Climatic conditions
- Vegetation
- Soil and root zone
- Unsaturated zone

# GROUNDWATER RECHARGE

## Recharge : water transfer from precipitation to groundwater

😊 Groundwater flow models: **Sophisticated and accurate**

😢 Recharge modeling: **Challenge**

- Complex hydrological component

**Groundwater recharge depends on:**

- Climatic conditions
- Vegetation
- Soil and root zone
- Unsaturated zone

**Values can not be directly measured**

**Estimation**

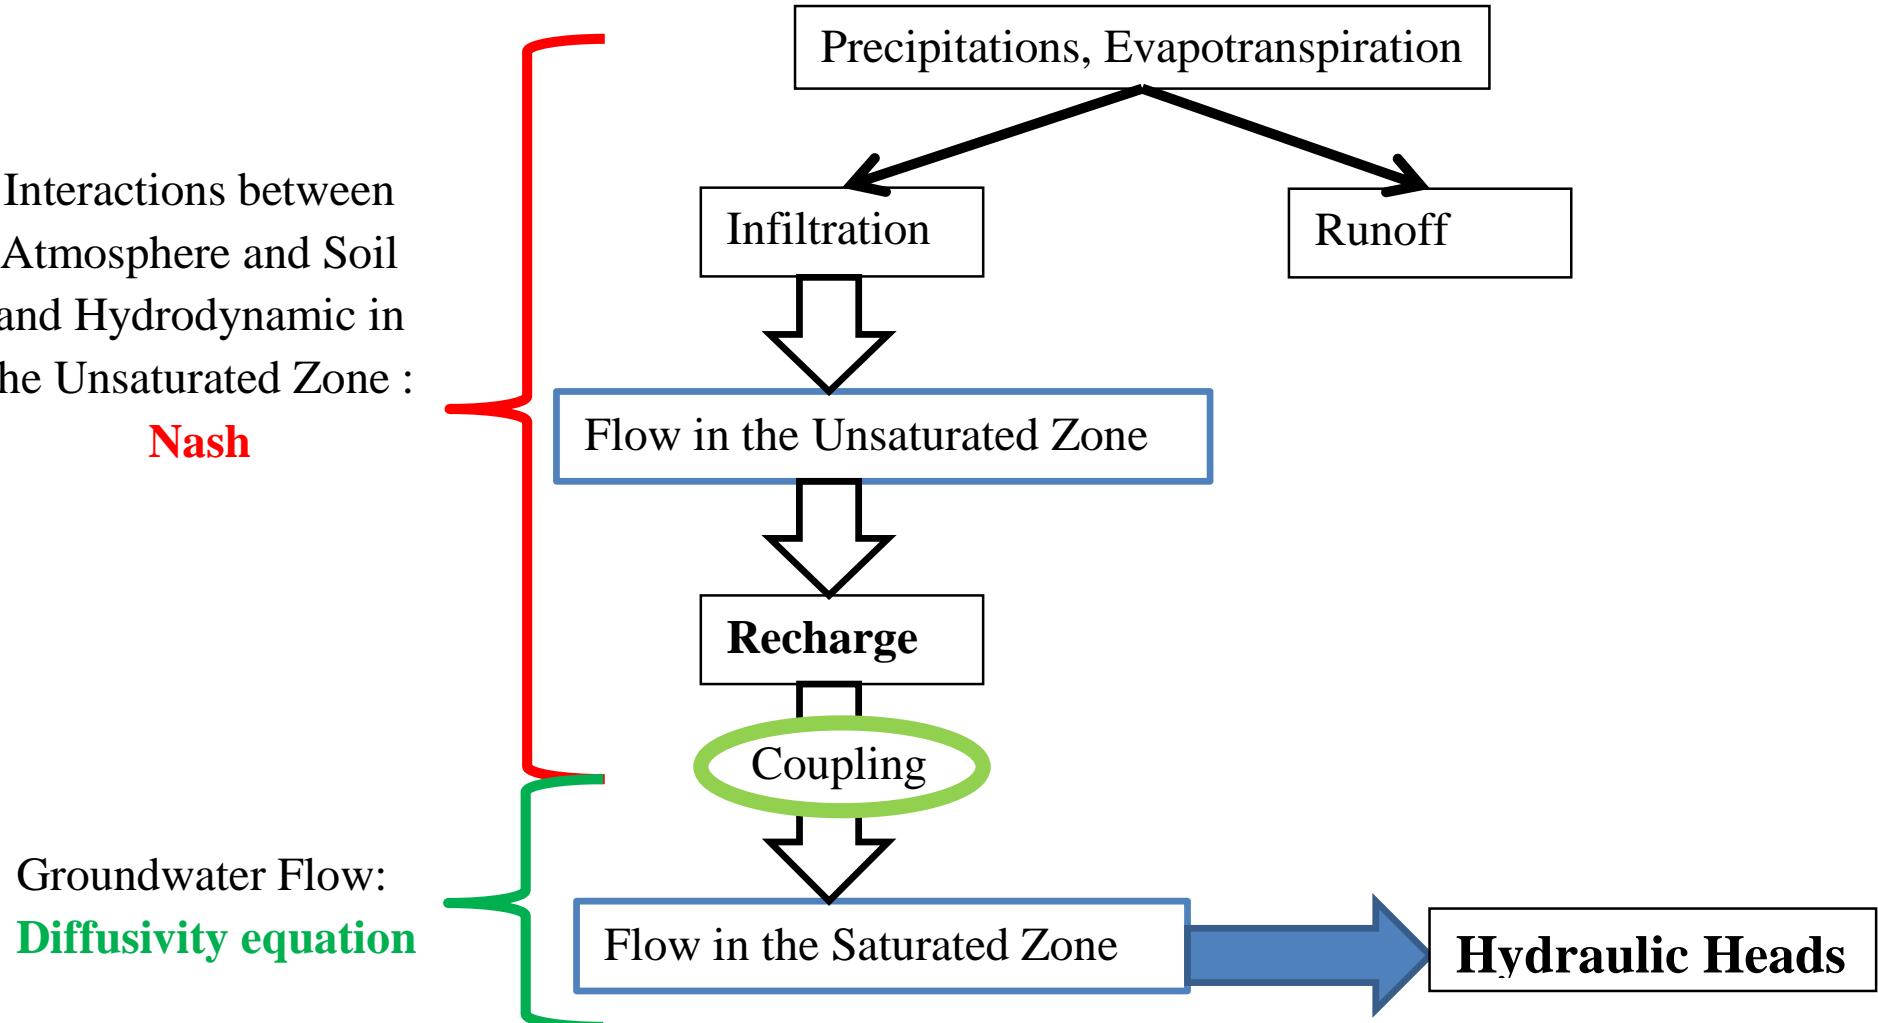

- Direct methods: lysimeters, TDR
- Empirical methods
- Tracers
- **Mathematical models**

# RECHARGE ESTIMATION: COUPLED MODEL

**Simulation of flow in both unsaturated and saturated zones**

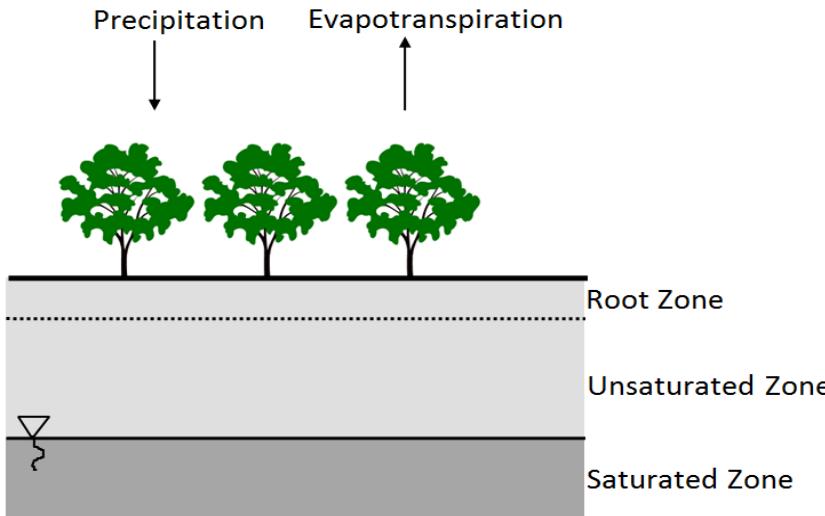

Interactions between Atmosphere and Soil and Hydrodynamic in the Unsaturated Zone :

Nash

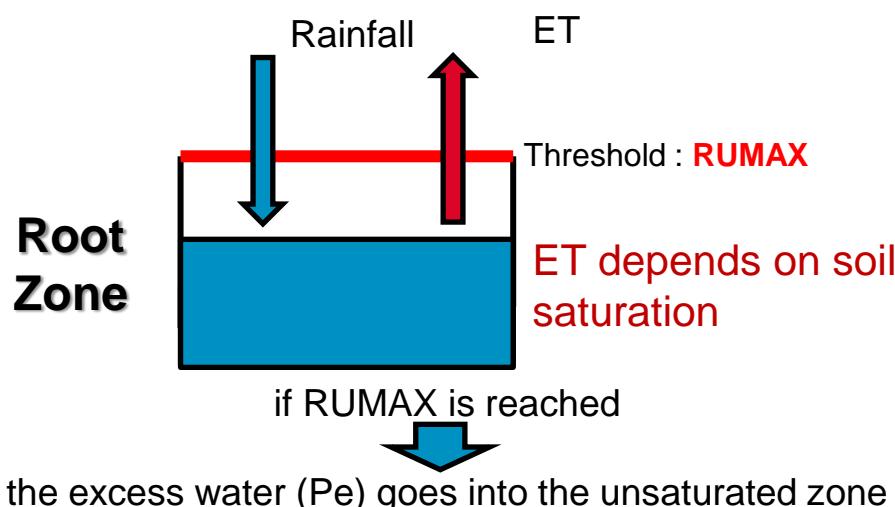

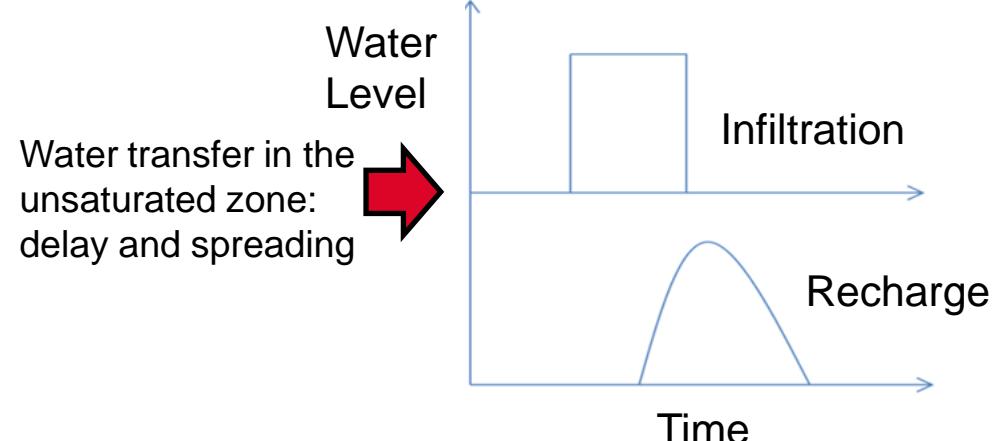

Groundwater Flow:  
**Diffusivity equation**

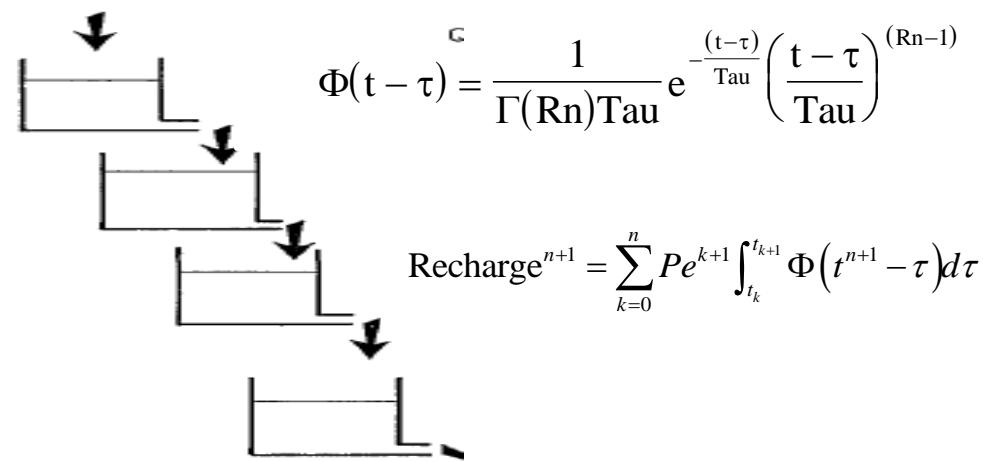

# NASH MODEL

## Hydrodynamic in the unsaturated zone

## Modeling : propagation of a unit pulse signal

Nash parameters: **RUMAX, RN, TAU**

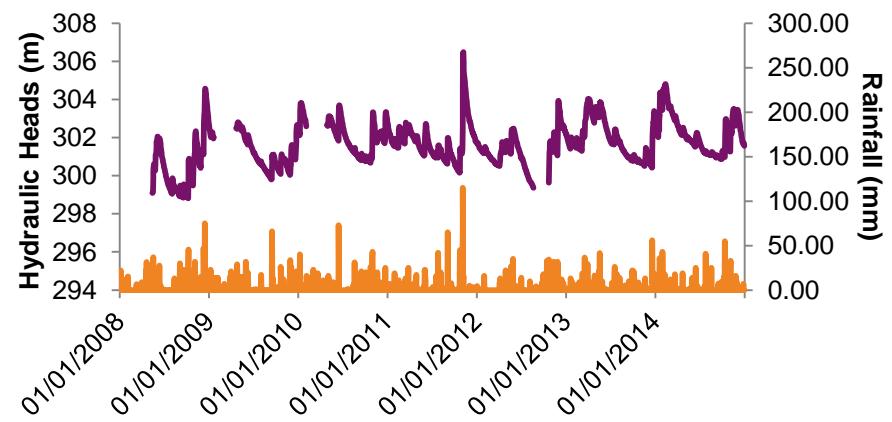

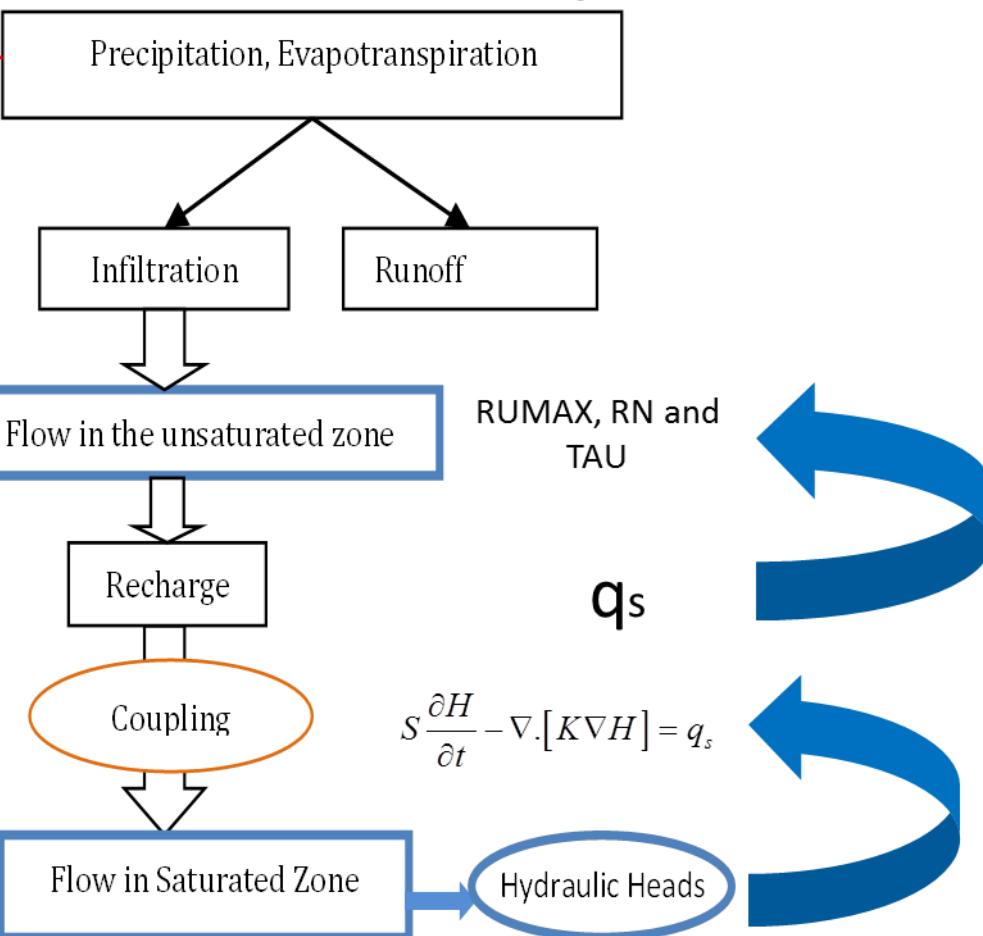

# PARAMETERS ESTIMATION

- ⌚ Model uses constants called parameters
- ⌚ **Aquifers are highly heterogeneous → Parameters are not known accurately or even unknown in natural environments**

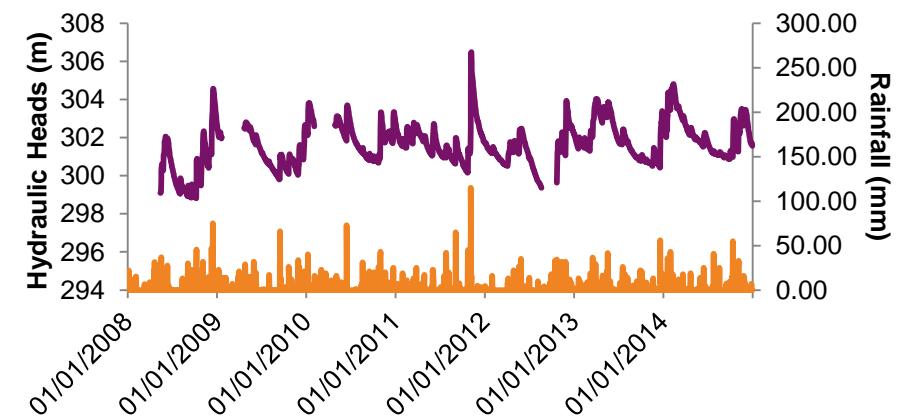

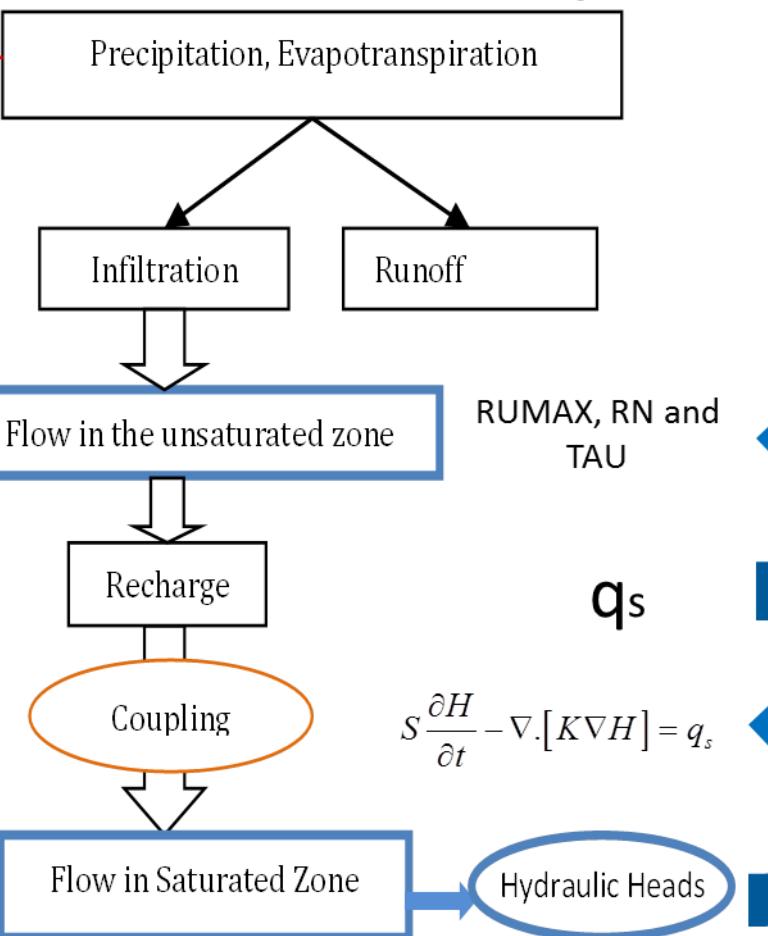

# PARAMETERS ESTIMATION

- (?) Model uses constants called parameters
- (?) Aquifers are highly heterogeneous → Parameters are not known accurately or even unknown in natural environments
- (?) Available data: meteorological and piezometric levels

# PARAMETERS ESTIMATION

- (?) Model uses constants called parameters
- (?) Aquifers are highly heterogeneous → Parameters are not known accurately or even unknown in natural environments
- (?) Available data: meteorological and piezometric levels

**Recharge is estimated by calibrating piezometric levels**

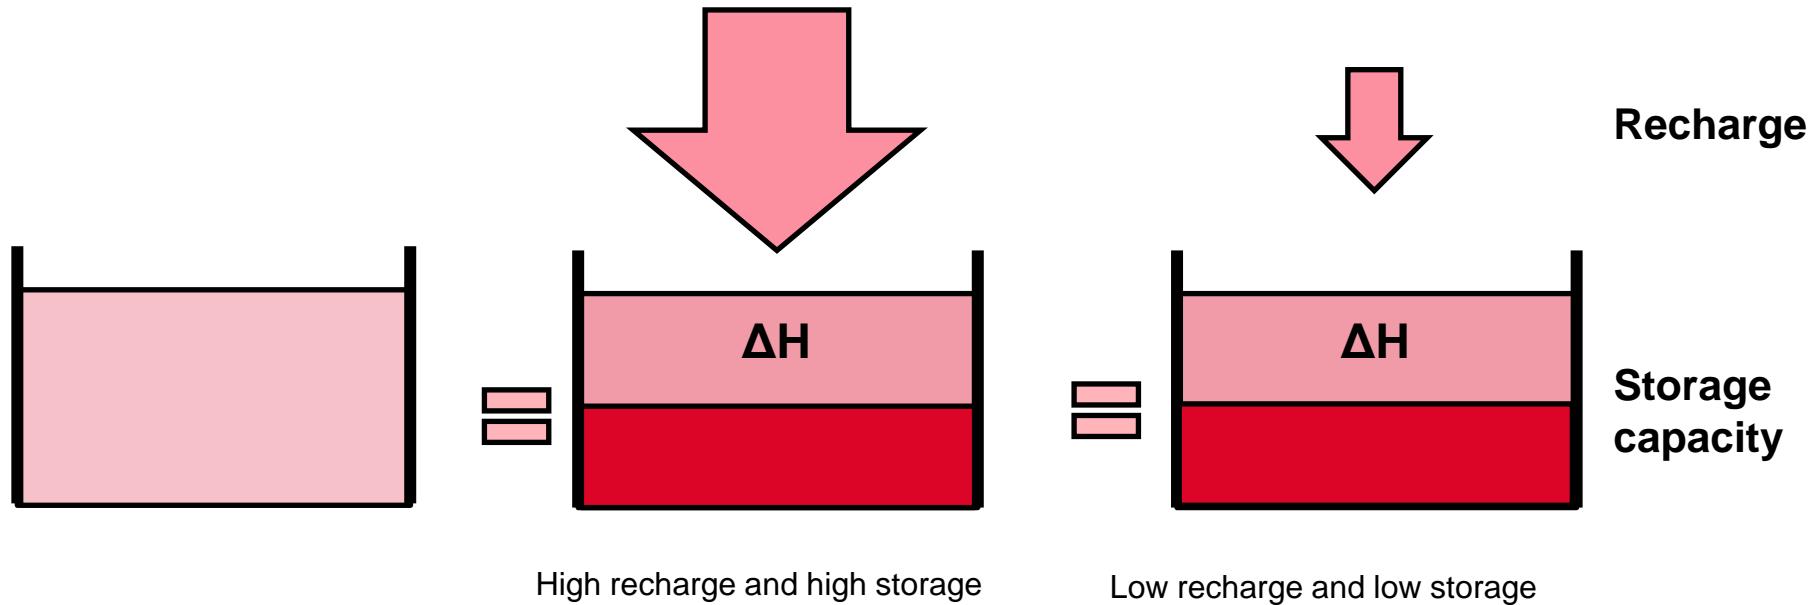

**Simultaneous estimation of groundwater flow and recharge parameters from hydraulic heads variations**

$$S \frac{\partial H}{\partial t} - \nabla \cdot [K \nabla H] = q_s$$

# GLOBAL SENSITIVITY ANALYSIS

## ☺ Correlation between recharge and storage capacity (S and $q_s$ )

Recharge and storage capacity lead to the same effect

$$q = -K\nabla H \quad \text{Determine } q \text{ et } K \text{ knowing } H !$$

- ☺ Calibration is performed over time and space
- ☺ But... recharge is variable over time while the storage capacity is constant

When  $q = 0 \rightarrow 0 = -K\nabla H \rightarrow$  Determination of K

When  $q \neq 0 \rightarrow$  Determination of q knowing K

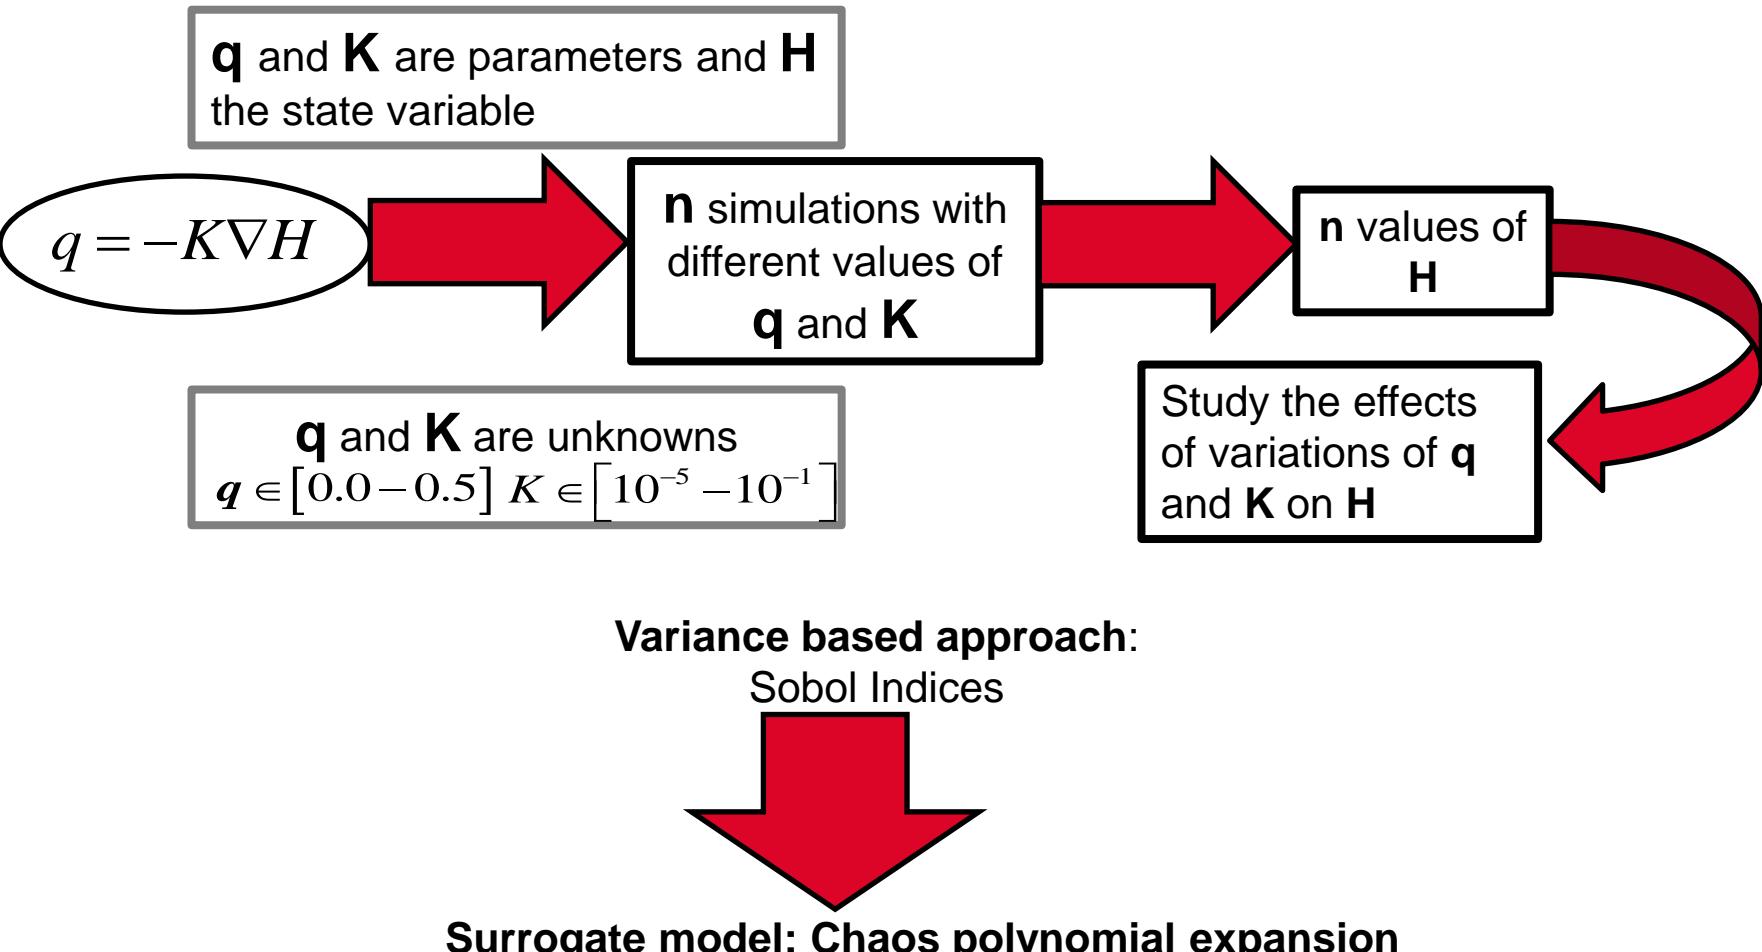

## ☺ Global sensitivity analysis

**Assess the calibration approach and guide the parameter estimation**

# GLOBAL SENSITIVITY ANALYSIS

**Uncertain parameters:** variability ranges known → Quantify the effects of parameters uncertainty

**Global sensitivity analysis:** focuses on the output uncertainty over the entire range of values of the input parameters both single and in combination with one another

# SOBOL INDICES : CHAOS POLYNOMIAL EXPANSION

Let us consider a model with  $y$  as output and  $n$  input parameters,  $X$  the parameters vector

➤ **ANOVA decomposition** :  $y = f_0 + \sum_{i=1}^n f_i(x_i) + \sum_{j>1}^n f_{ij}(x_i, x_j) + \dots + f_{1,2,\dots,n}(x_1, x_2, \dots, x_n)$

$f_i$  : contribution of single parameter  $i$  to the output

$f_{ij}$  : contribution of the combined effect of parameters  $i$  and  $j$  to the output

$$H = H_0 + f_s(S) + f_K(K) + f_{RN}(RN) + f_{RN,K}(RN, K) + f_{S,K}(S, K) + \dots$$

**Orthogonality of f**  $V = \sum_{i=1}^n V_i + \sum_{j>1}^n V_{ij} + \dots + V_{1,\dots,n}$

➤ **Sensitivity (Sobol) Indices** :  $S_i = \frac{V_i}{V}; S_{ij} = \frac{V_{ij}}{V}$

**Computation of f** **Polynomial expansion**

➤ **Chaos polynomial expansion**

$$y = \sum_{j=0}^{+\infty} a_j \psi_j(x_1, \dots, x_n)$$

$x$  : variable

$\Psi$  : orthogonal polynomial (Legendre, Hermite)

$a$  : coefficients determined by least squares regression

# GLOBAL SENSITIVITY ANALYSIS

## Field based sensitivity analysis

- A subdomain of the Upper Rhine alluvial aquifer

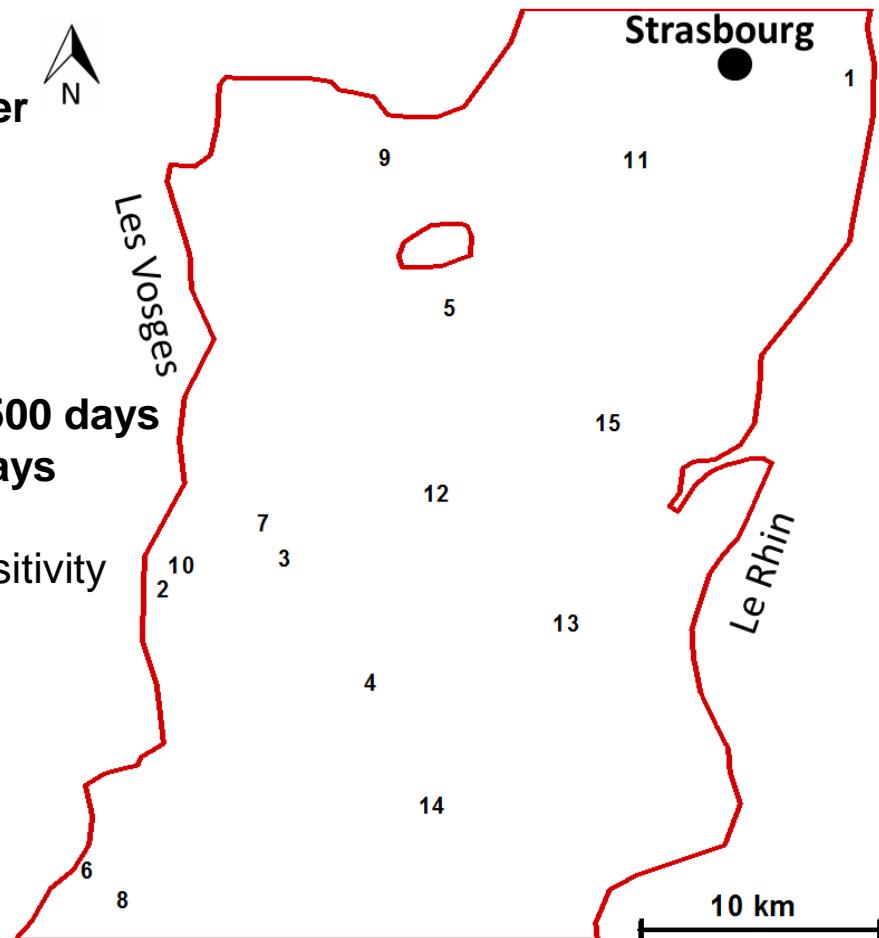

widely studied at Université de Strasbourg

- Average rainfall per year: **1100 mm**
- Average of evapotranspiration per year: **900 mm**

- Simulate variations of piezometric levels during **1500 days**
- Sensitivity analysis performed over the last **450 days**

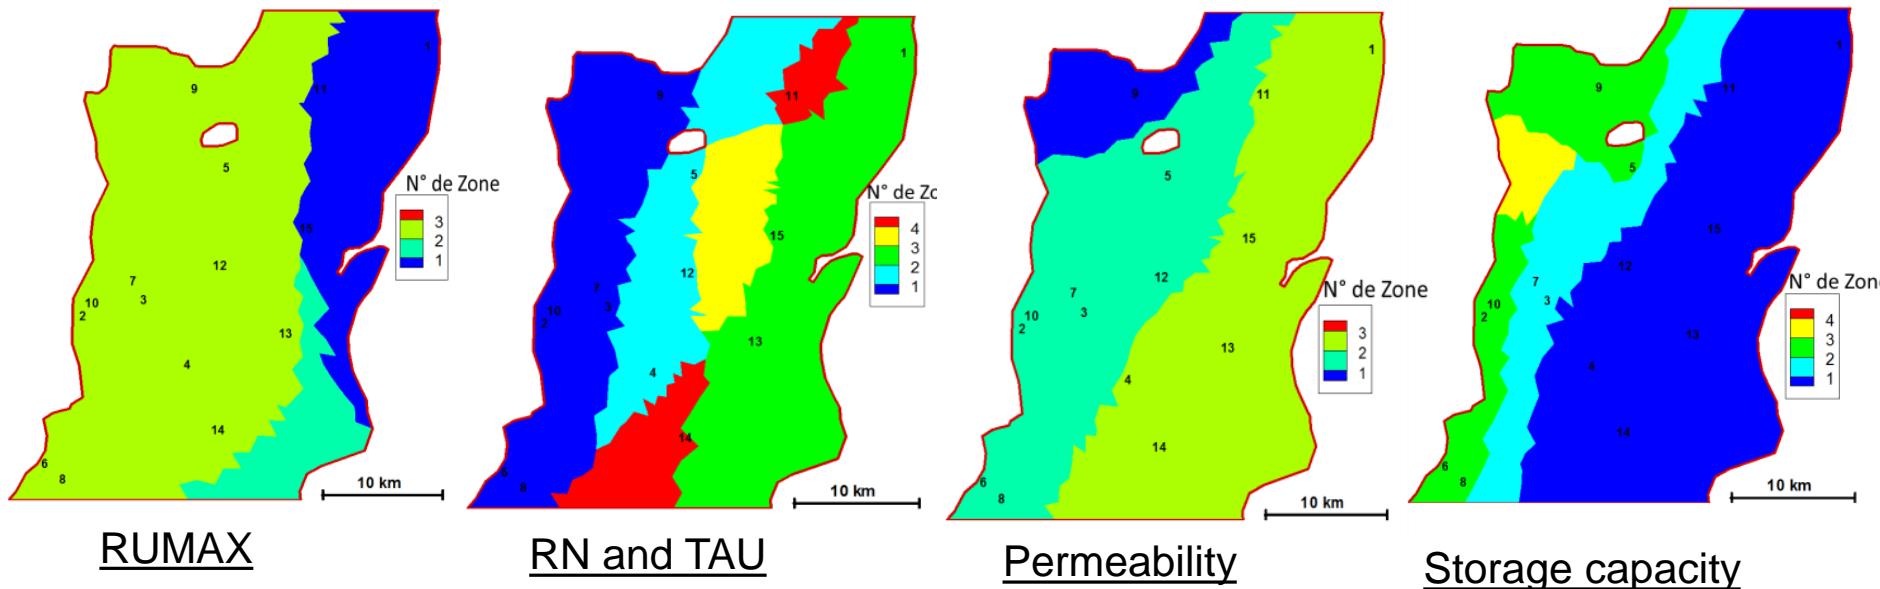

- Investigate spatial and temporal variations of sensitivity indices

- 1500 simulations of Quasi Monte Carlo

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

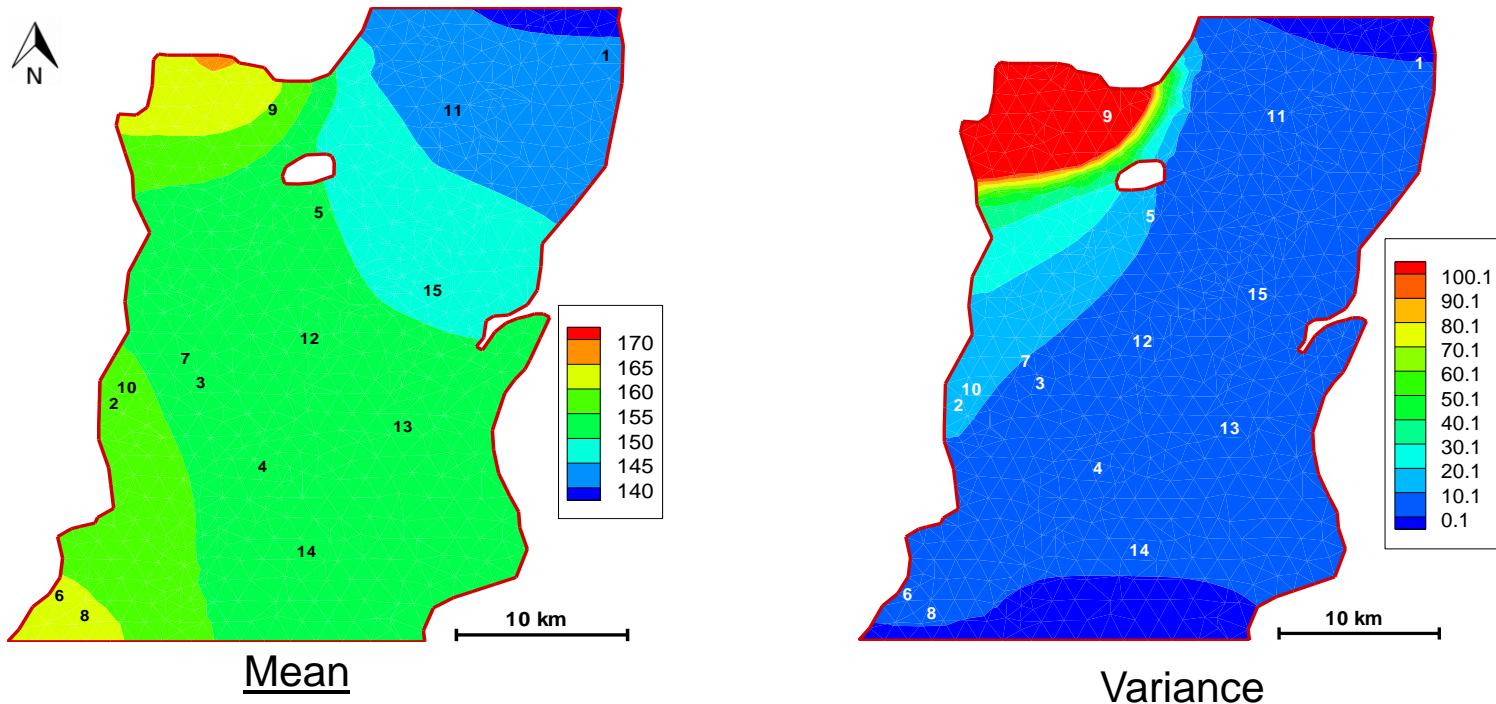

- Nash parameters for recharge: **RUMAX, RN, TAU**
- Aquifer parameters: **K and S**
- Parameters defined by zones (**Zonation**) → 20 parameters

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

- Nash parameters for recharge: **RUMAX, RN, TAU**
- Aquifer parameters: **K and S**
- Parameters defined by zones (**Zonation**) → 20 parameters

## Mean and Variance of the hydraulic head

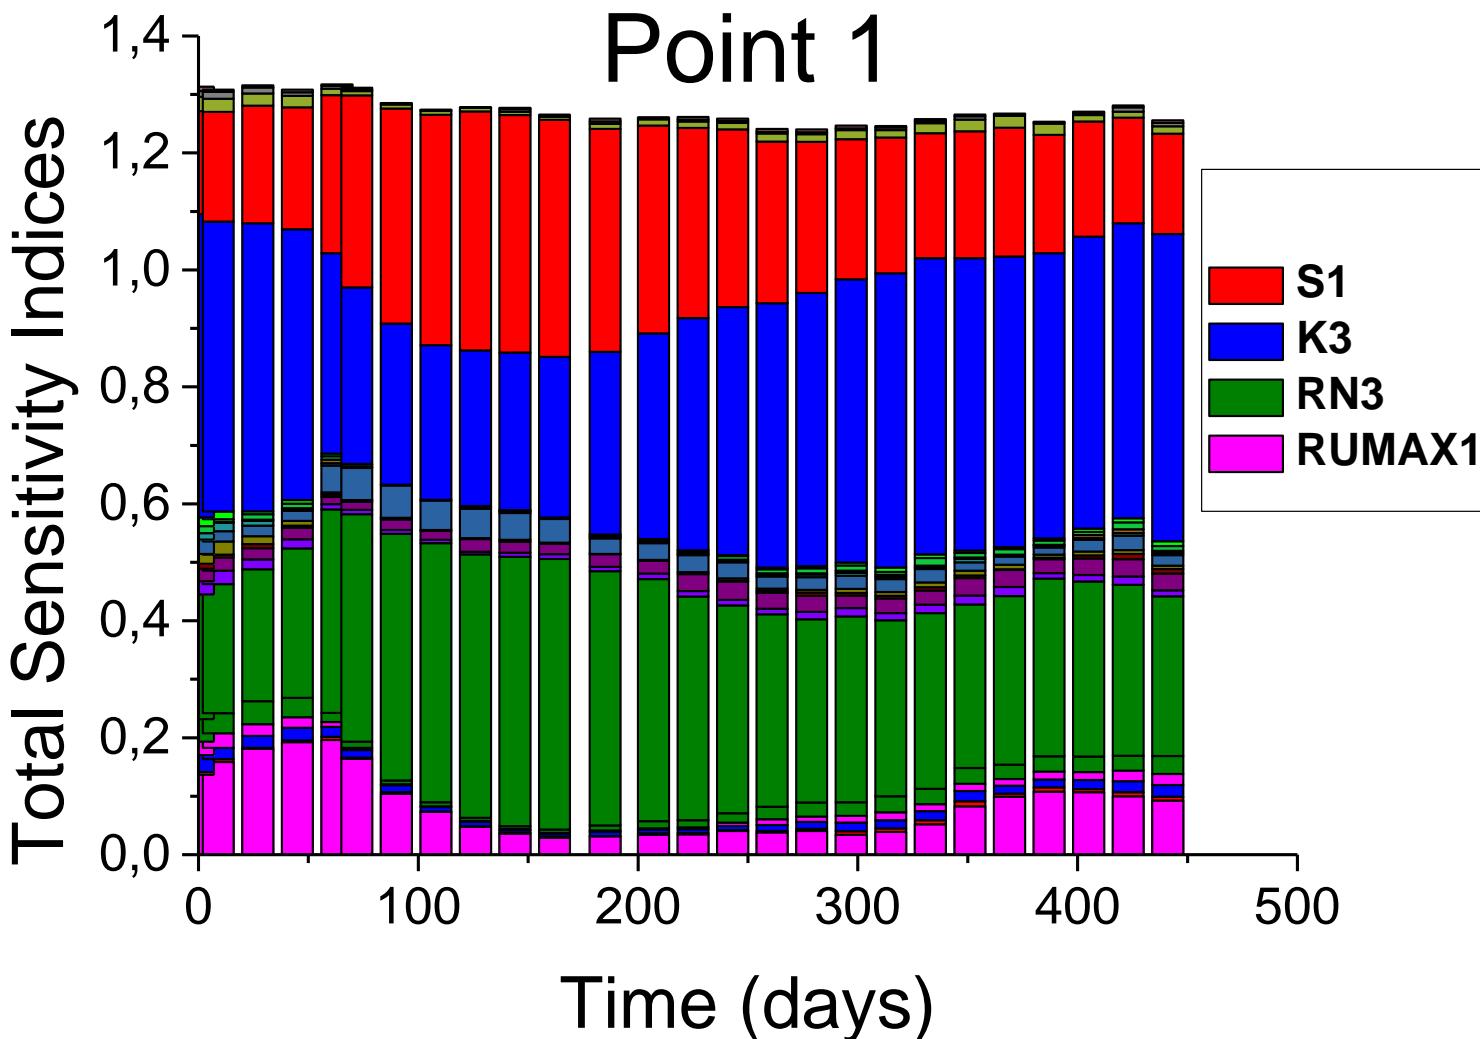

- Hydraulic heads range between 140 and 165 m
- Variance ranges between 0 and 100: the imposed boundaries have the lowest variance

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

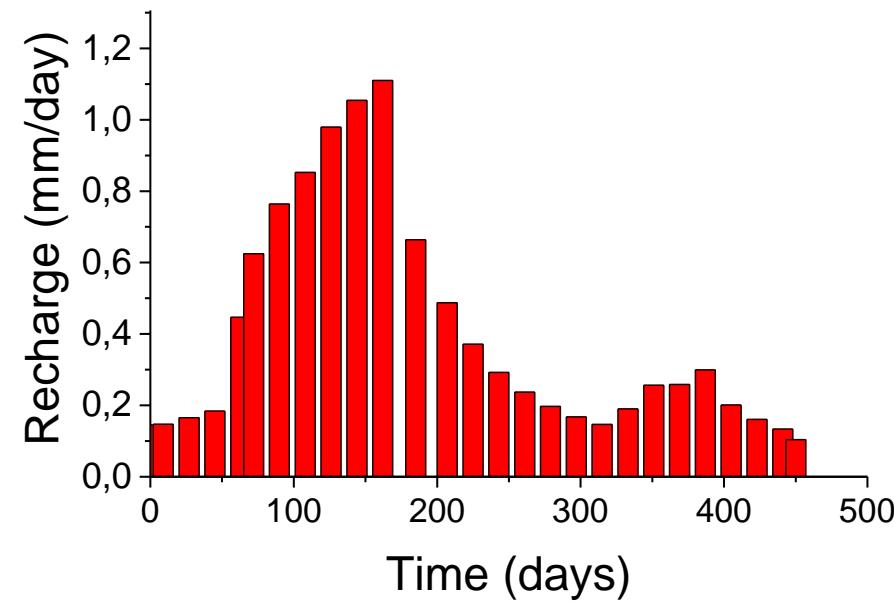

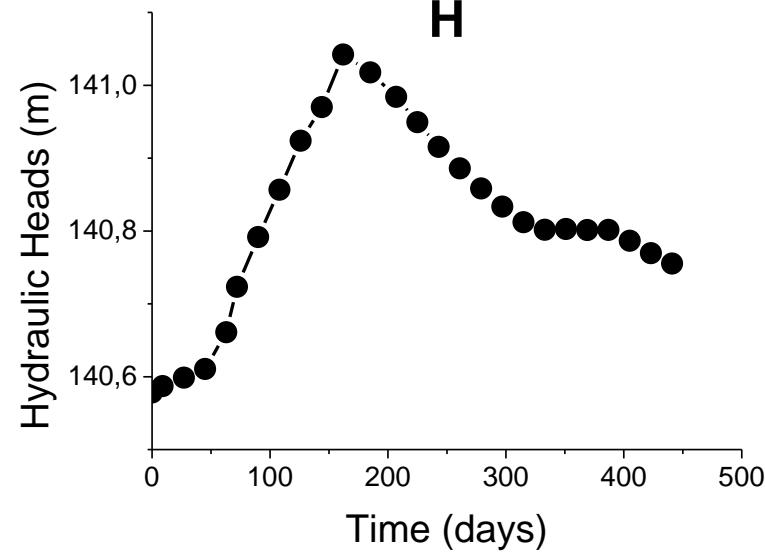

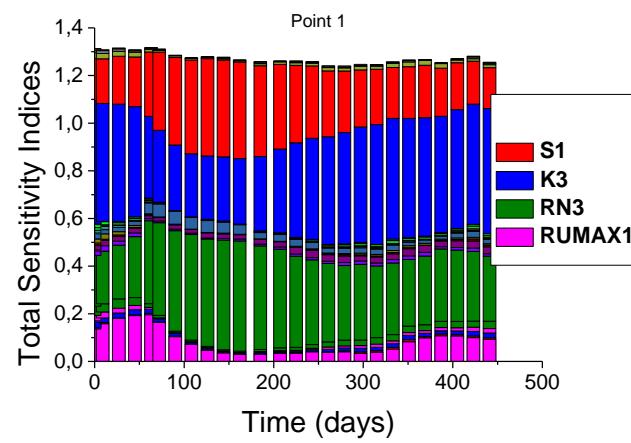

Temporal variation of sensitivity indices at point 1

Influential parameters: **S**, **K**, **RUMAX**, **RN**

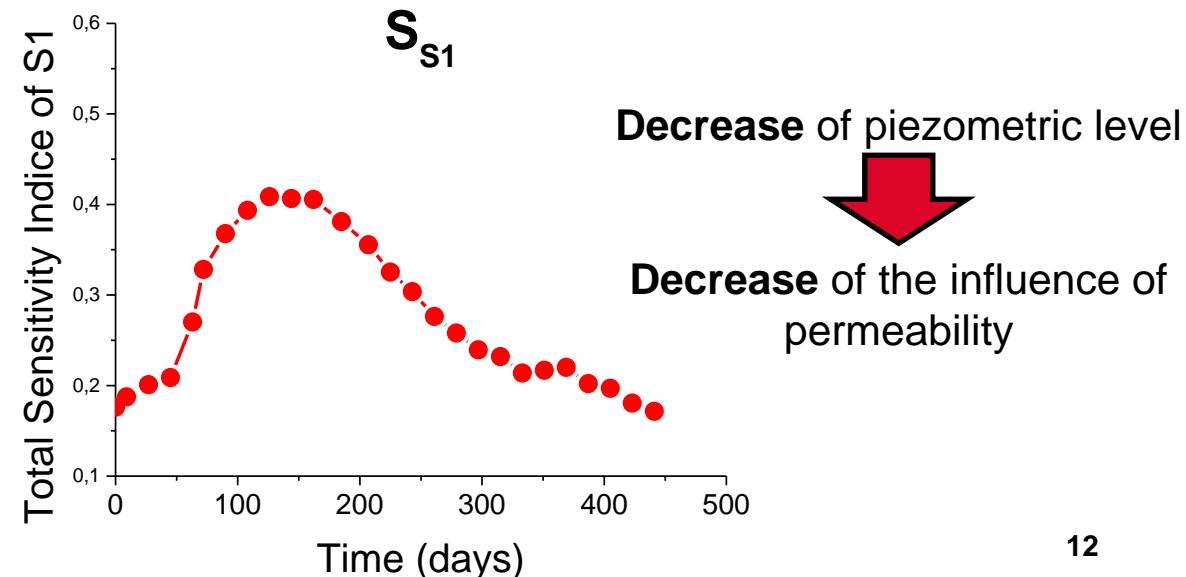

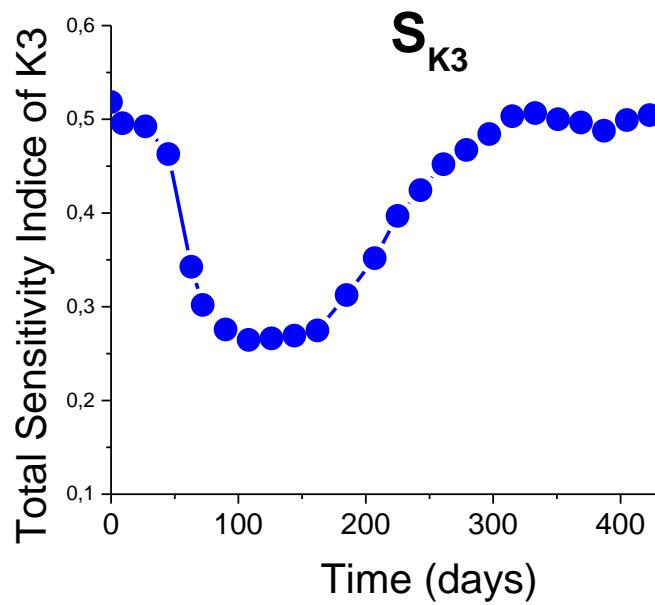

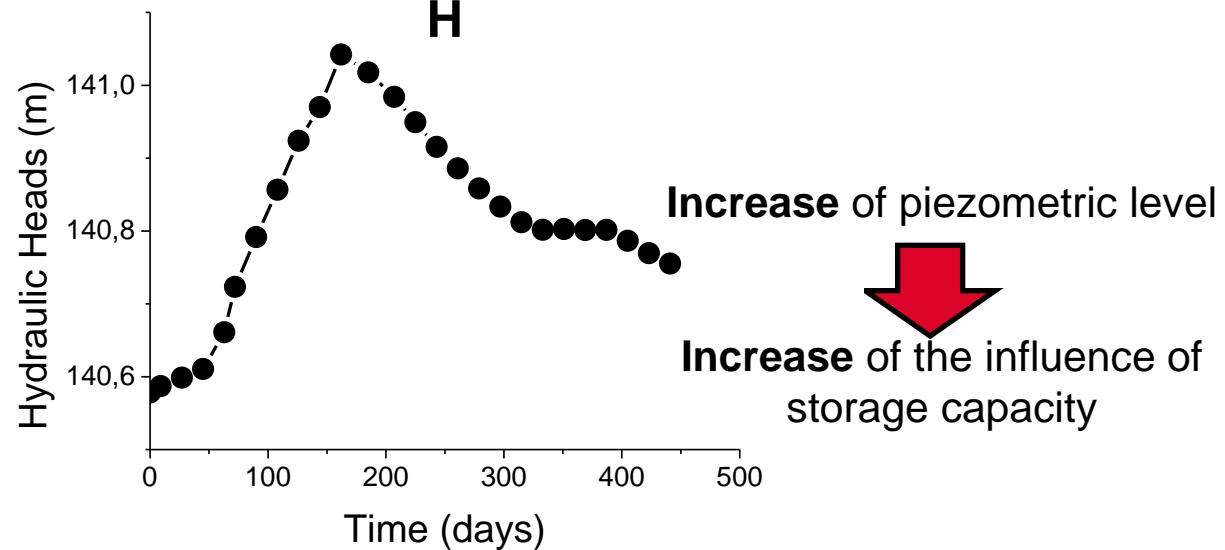

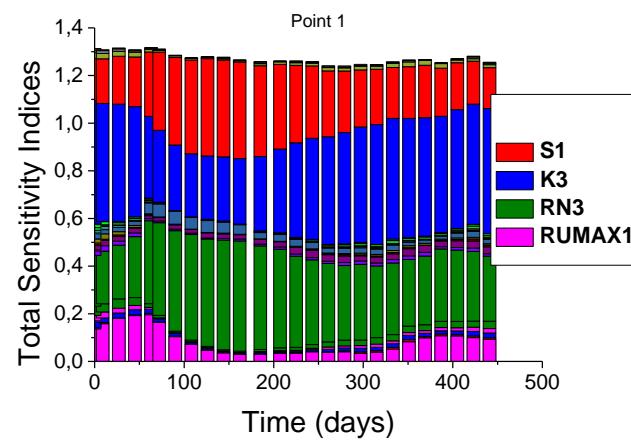

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

**Temporal variation of sensitivity indices at point 1**

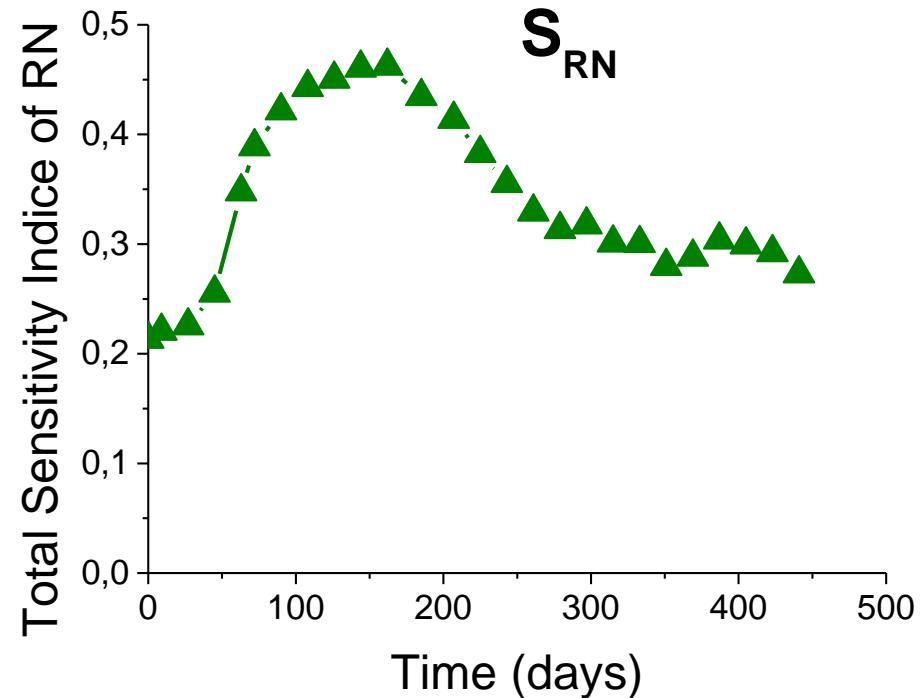

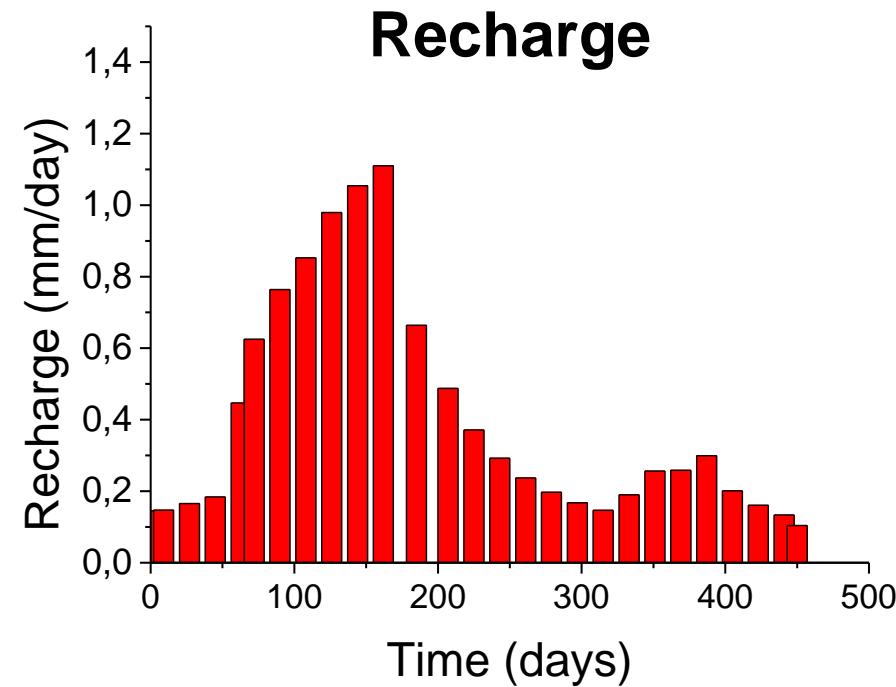

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

**Temporal variation of sensitivity indices at point 1**

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

Temporal variation of sensitivity indices at point 1

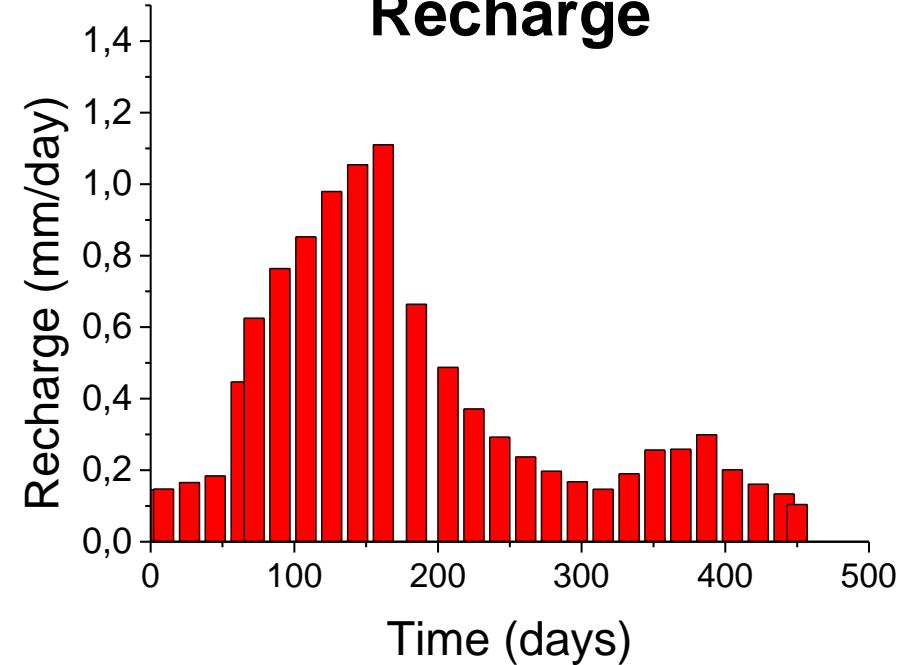

RN: water transfer in the unsaturated zone  
(delay and spreading)  
RUMAX: threshold parameter

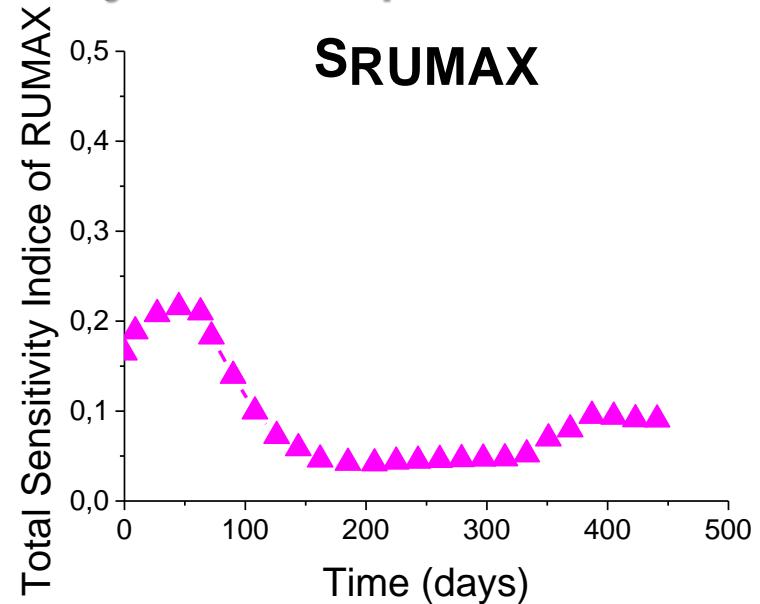

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

## Temporal variation of sensitivity indices at point 1

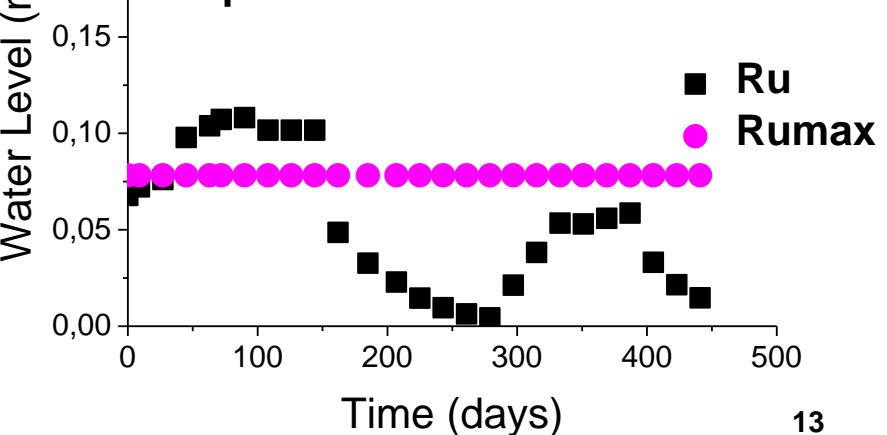

### Recharge

### SRUMAX

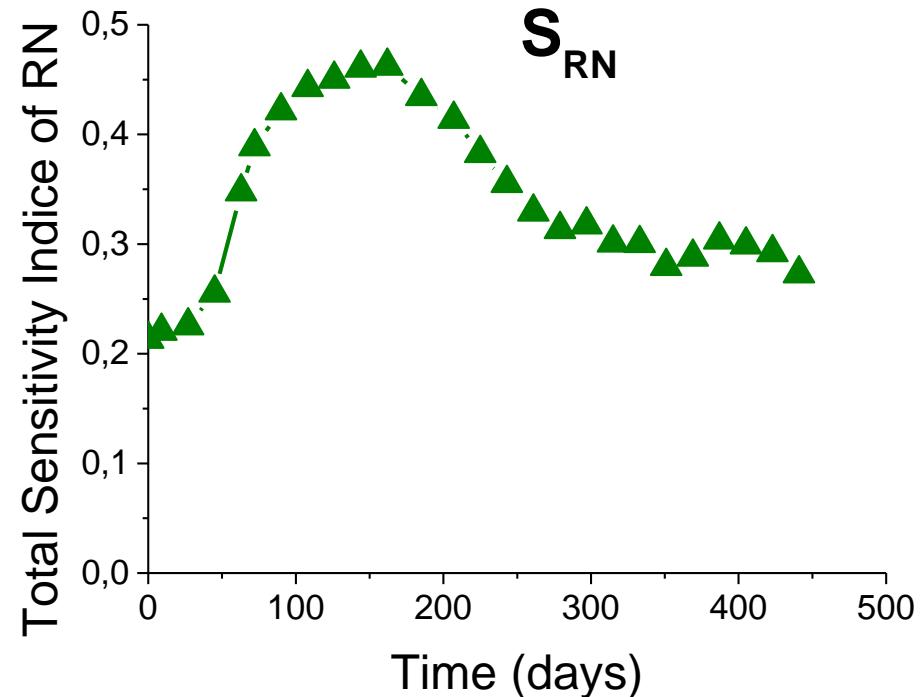

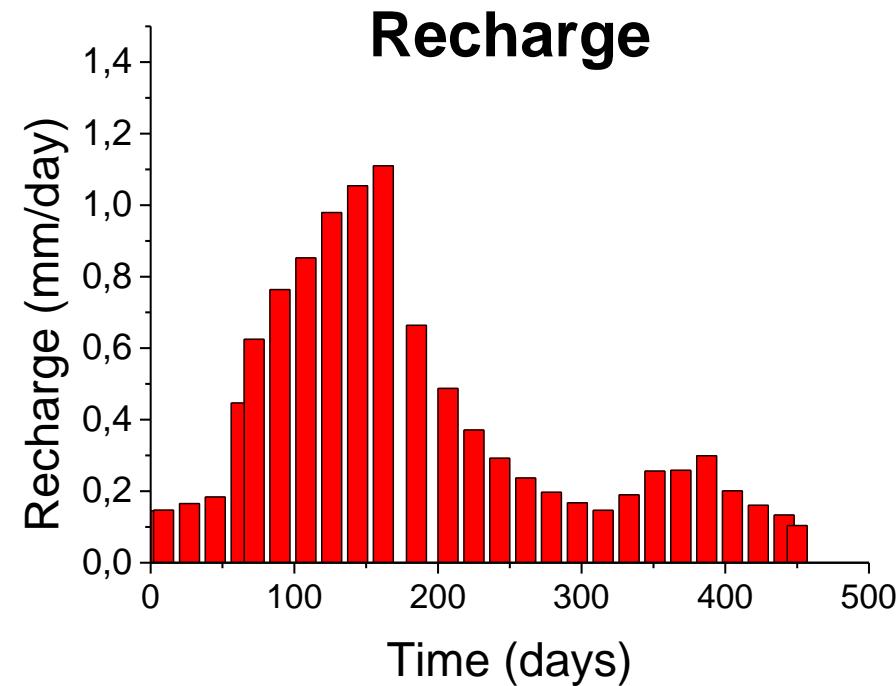

### Temporal Variation of RU and RUMAX

RN: water transfer in the unsaturated zone  
(delay and spreading)  
RUMAX: threshold parameter

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

Temporal variation of sensitivity indices at point 1

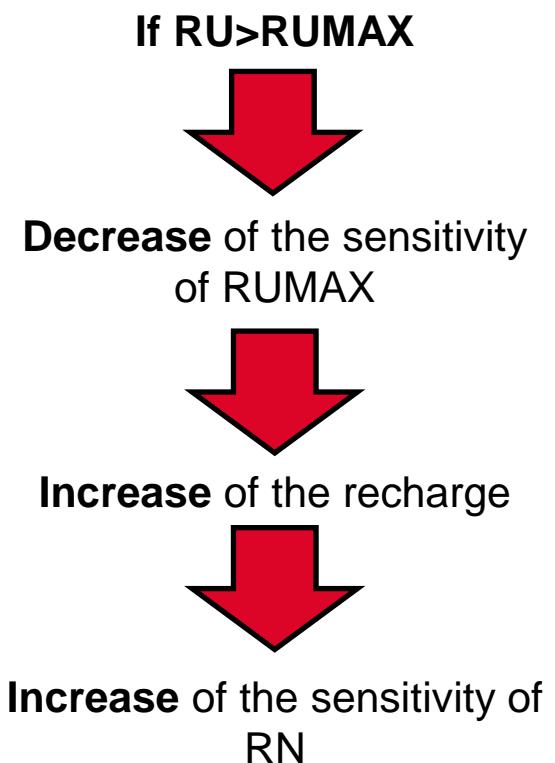

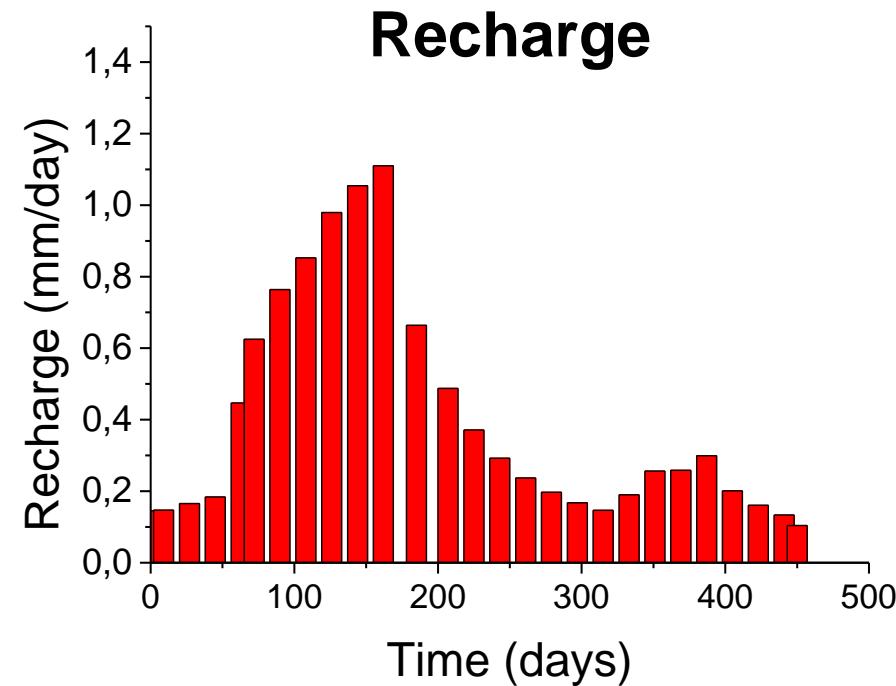

RN: water transfer in the unsaturated zone  
(delay and spreading)

RUMAX: threshold parameter

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

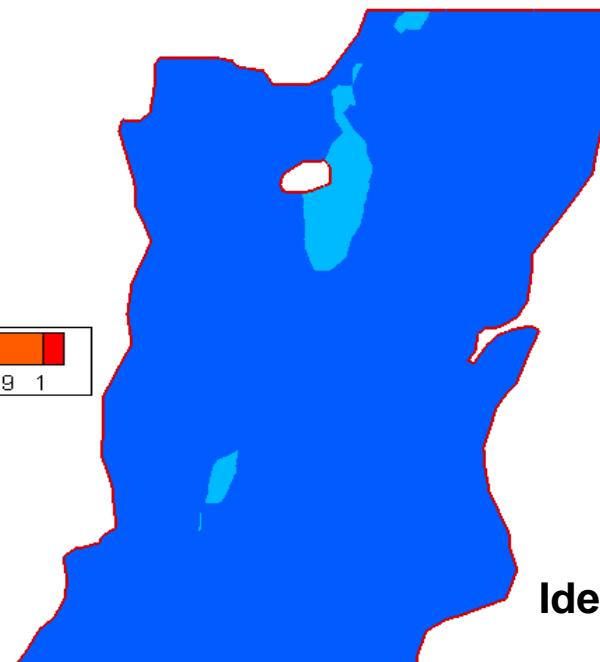

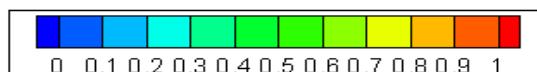

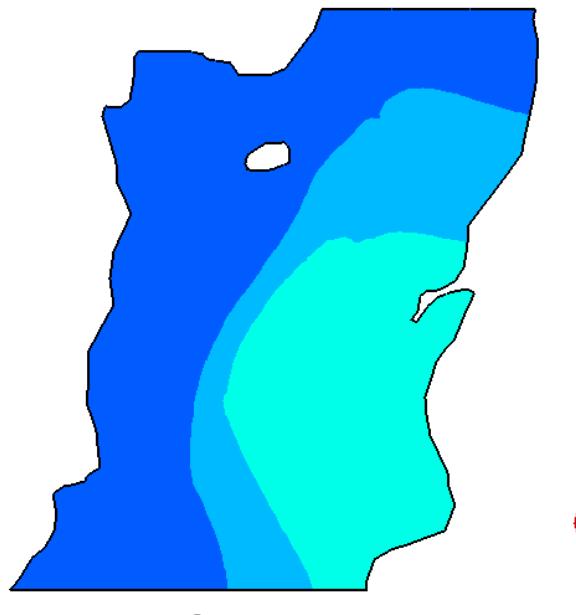

Temporal variation of sensitivity indices at point 1

**RN:** water transfer in the unsaturated zone  
(delay and spreading)  
**RUMAX:** threshold parameter

# GLOBAL SENSITIVITY ANALYSIS: NASH MODEL

## Sensitivity maps over time

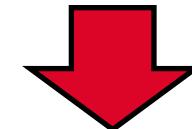

**RUMAX3:** sensitive from the 1<sup>st</sup> to 185<sup>th</sup> day  
**S1:** influential between the 185<sup>th</sup> and the 346<sup>th</sup> day

Weak or even negligible correlations between the 185<sup>th</sup> and the 346<sup>th</sup> day

Identification of S

During the first days

Identification of RUMAX and RN knowing S

# GLOBAL SENSITIVITY ANALYSIS: CONCLUSION

- Determination of influential parameters

**Nash:** RUMAX and RN

**Groundwater flow:** K and S

- Temporal variation of parameter sensitivity

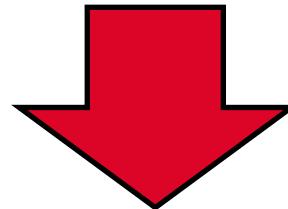

**Nash:** saturation of the 1<sup>st</sup> reservoir (RUMAX) and recharge (RN)

**Permeability:** decrease of the hydraulic heads

**Storage capacity:** increase of the hydraulic heads

- Weak interactions between aquifer and recharge parameters

$$q = -K \nabla H \quad K \text{ constant, } q \text{ variable} \rightarrow q=0, \text{ détermination of } K$$

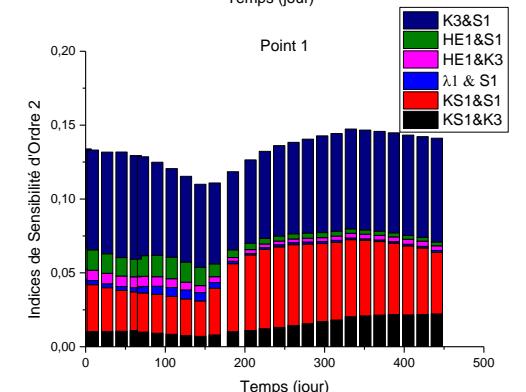

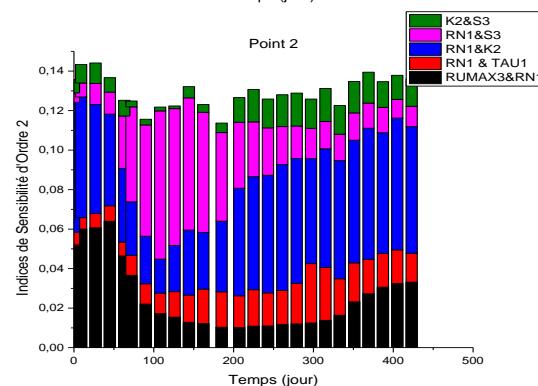

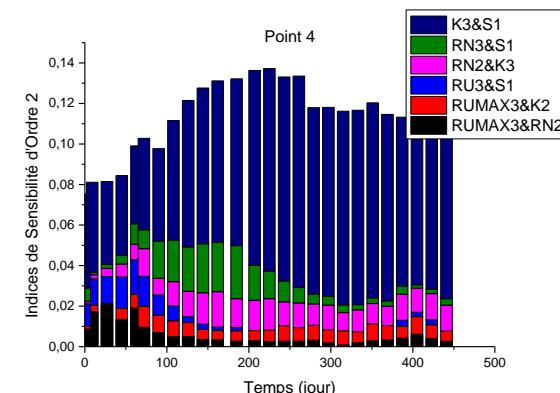

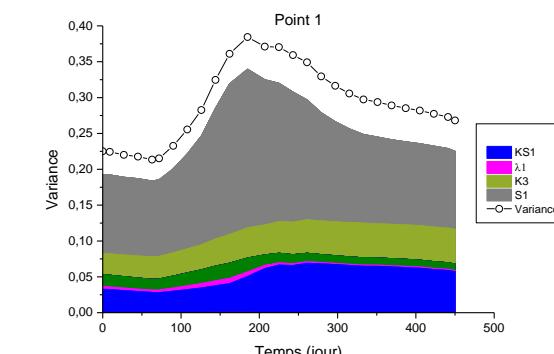

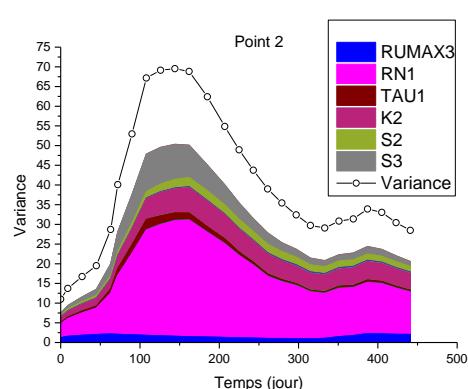

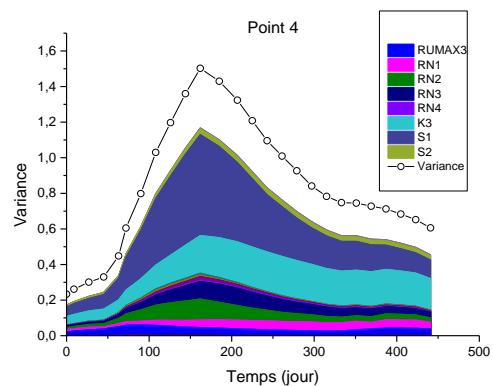

**Confirmation of the feasibility of simultaneous estimation of recharge and groundwater flow parameters**

*Thank you for  
your attention*

## Parameters Interactions

Nash model

# PARAMETER ESTIMATION

Diffusivity equation (Transient state with recharge )

$$S \frac{\partial H}{\partial t} - \nabla \cdot [K \nabla H] = q_s$$

Steady state without recharge

$$-\nabla \cdot [K \nabla H] = 0$$

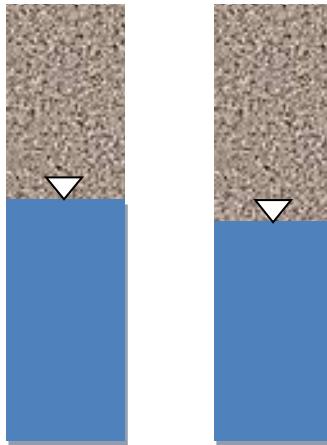

Steady state with recharge

$$-\nabla \cdot [K \nabla H] = q_s$$

Transient state without recharge

$$S \frac{\partial H}{\partial t} - \nabla \cdot [K \nabla H] = 0$$

## Assumption of constant hydraulic head over decade

$$q_i^n = -K \frac{\partial}{\partial z} (h - z) = K \left( h_{i+\frac{1}{2}} \right) \left( \frac{h_i^n - h_{i+1}^n}{\Delta z_i} + 1 \right)$$

If the hydraulic heads decreases, the imposed pressure decreases, and the flux calculated is positive and strong

If the hydraulic heads increases, the imposed pressure increases, and the flux calculated is negative

# RESOLUTION OF RICHARDS EQUATION
