# BASIC SCHEME AND EQUATIONS FOR ns-LASER HEATING

$$c(T) \frac{\partial T}{\partial t} = \text{div}(k(T) \nabla T) + Q(t, r, z)$$

$$Q(t, r, z) = I(t, r) A \alpha \exp(-\alpha z)$$

$$T(t = 0, r, z) = T_o \quad \text{and} \quad \left. \frac{\partial T(t, r, z)}{\partial z} \right|_{z=0} = 0$$

$c$  ( $\text{J m}^{-3} \text{K}^{-1}$ ) – thermal capacity;

$k$  ( $\text{W m}^{-1} \text{K}^{-1}$ ) – thermal conductivity;

$\alpha$  ( $\text{m}^{-1}$ ) – absorption coefficient of media;

$A$  – surface absorptivity at laser wavelength;

$$I (\text{W/cm}^2) \rightarrow T (\text{K}) = f(t, r, z)$$

for  $a \in [100 \mu\text{m} \rightarrow 10 \text{nm}]$

# “3D+t” HEATING CODE, Si -bulk

$$\Delta T (t, r = 0, z = 0) = f (t)$$

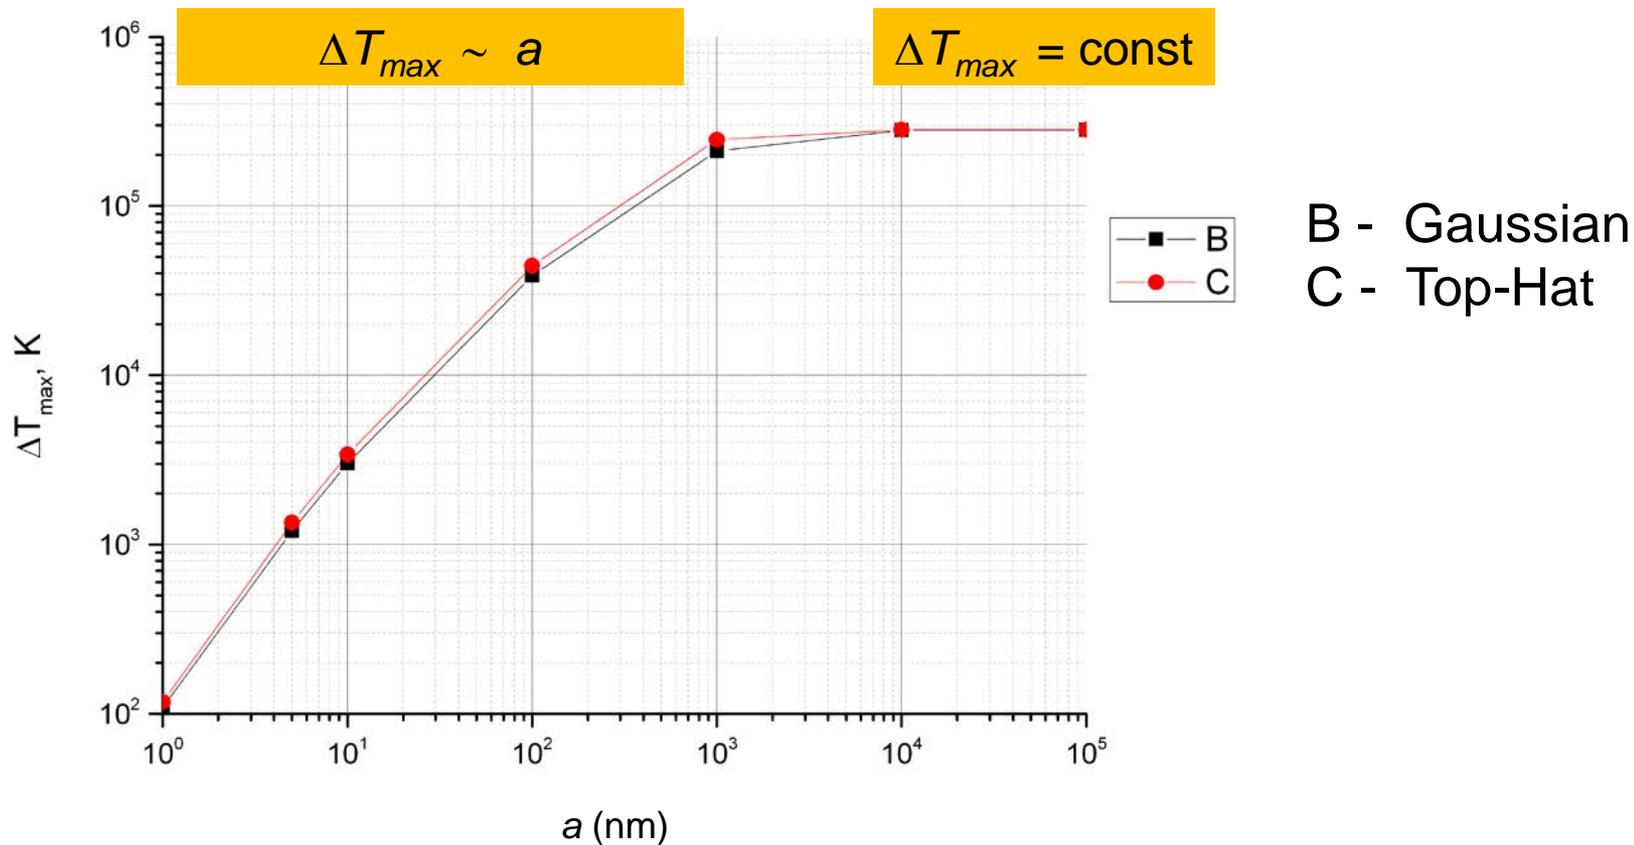

**Si-bulk:**  $c = 700 \text{ J/kg K}$ ,  $k = 149 \text{ W/m K}$ ,  $\rho = 2330 \text{ kg/m}^3$ ,  $\alpha = 200 \text{ }\mu\text{m}^{-1}$ ,  $A = 0.3$ .

**Laser:** Gaussian  $F(r) = F_0 \exp(-r^2/a^2)$ ,  $P(t) = P \sin^2(\pi t/2\tau)$  - pulse of  $\tau = 4 \text{ ns}$ ,  $\lambda = 266 \text{ nm}$ ,  $F = 100 \text{ J/cm}^2$ ;

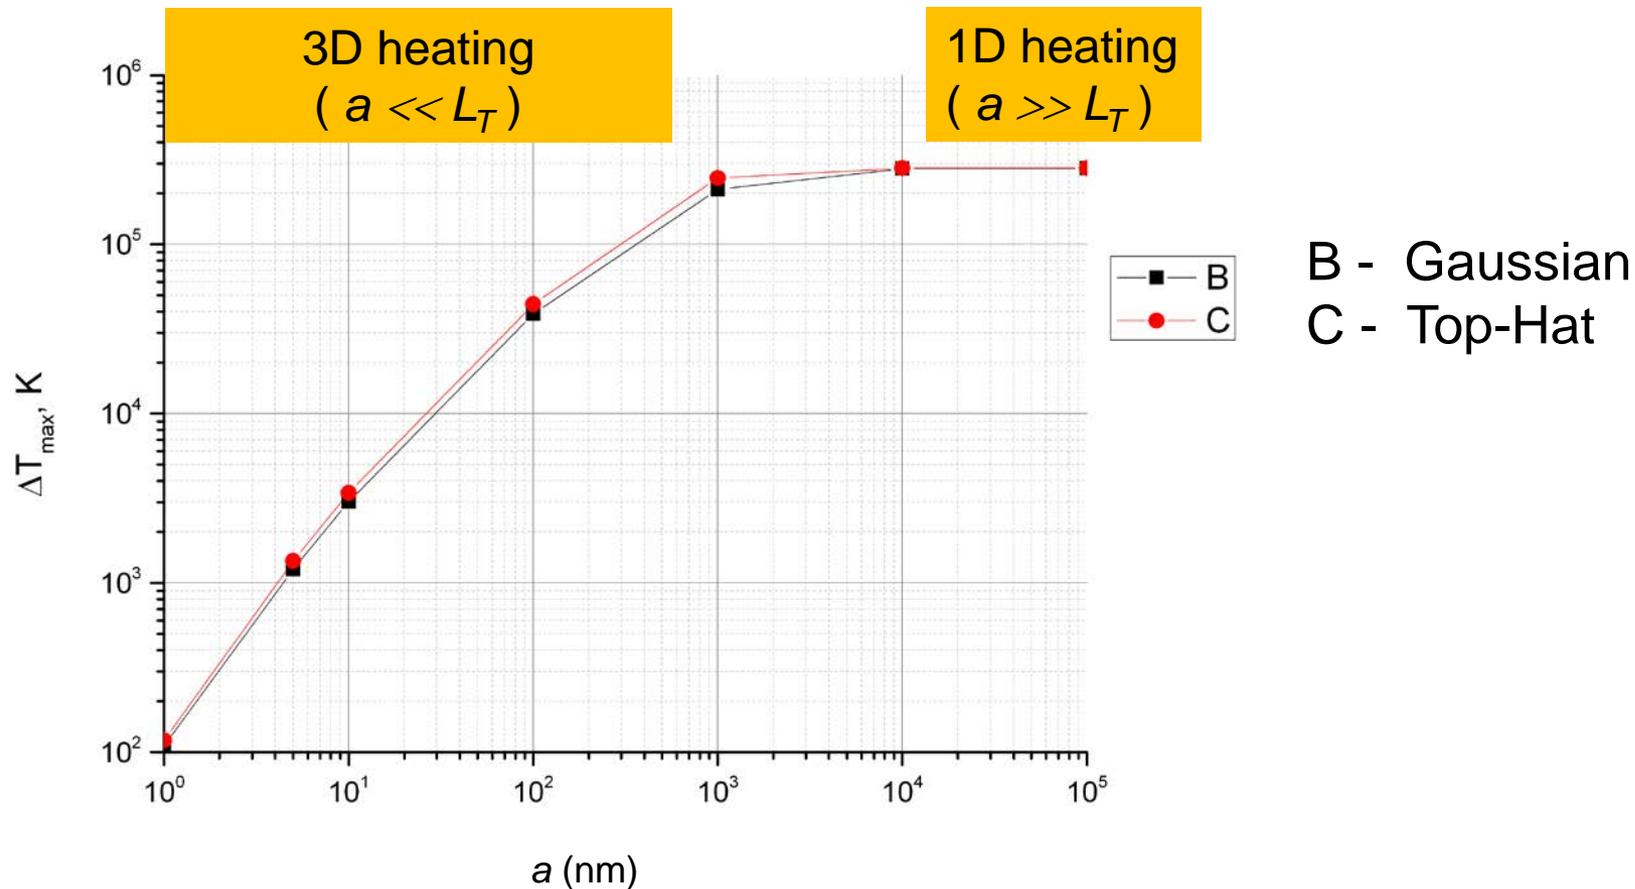

Total duration of calculation with time following laser pulse corresponding to 1 on x-axis is 20 ns.

# Heating temperature $\Delta T_{max} = f(a)$ for given $F = 100 \text{ J/cm}^2$

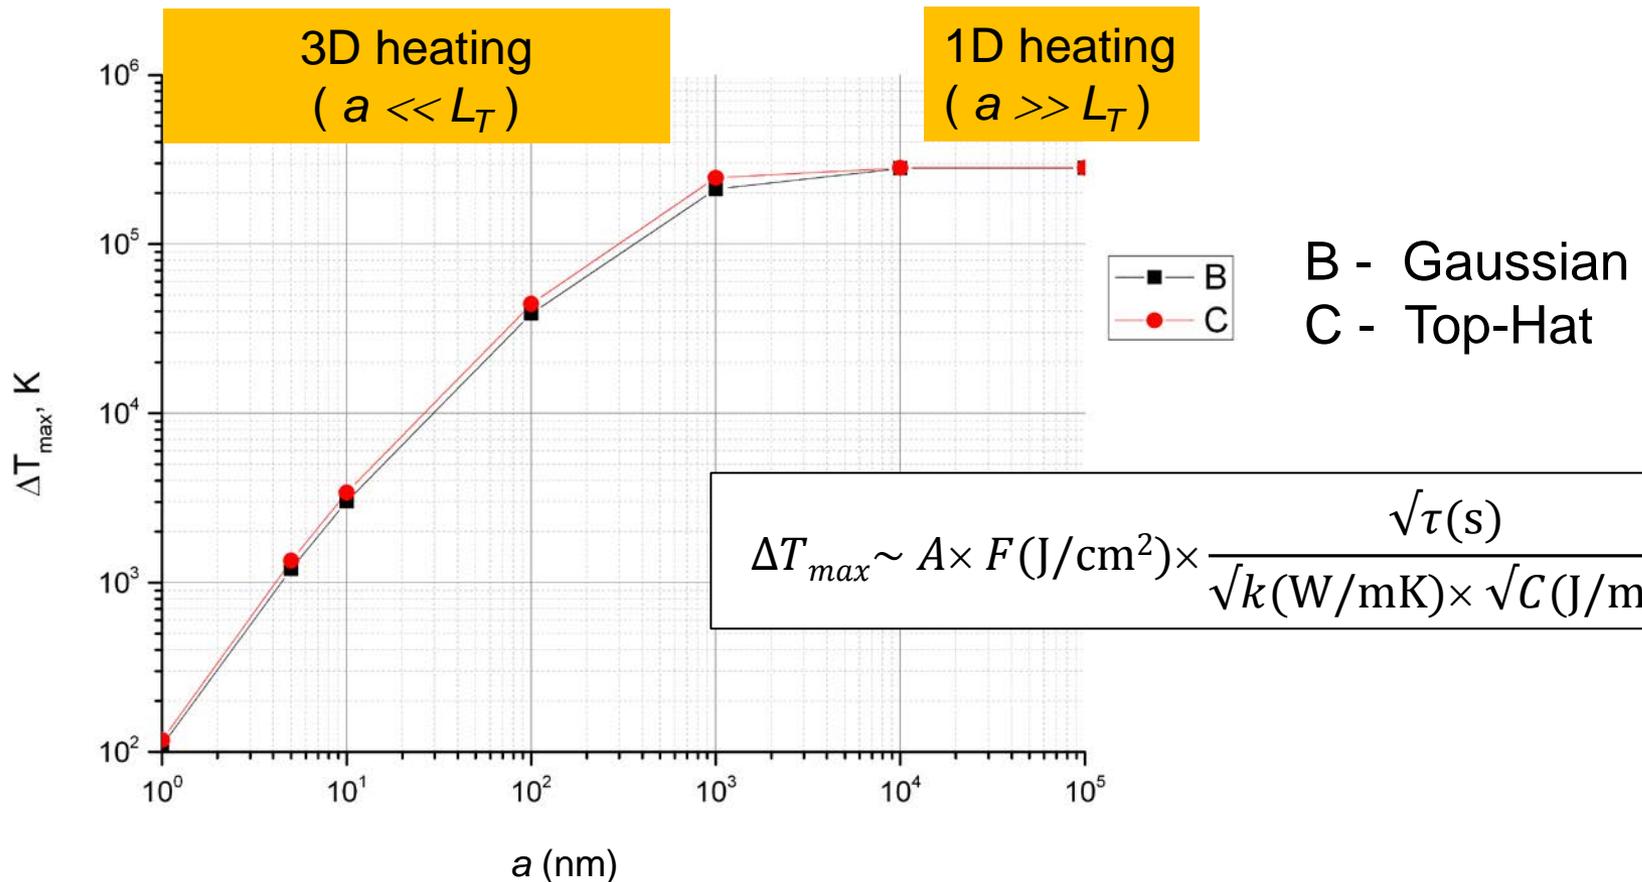

# Heating temperature $\Delta T_{max} = f(a)$ for given $F = 100 \text{ J/cm}^2$

$$\text{Heating length: } L_T = [4 \times D(\text{m}^2/\text{s}) \times \tau(\text{s})]^{0.5}$$

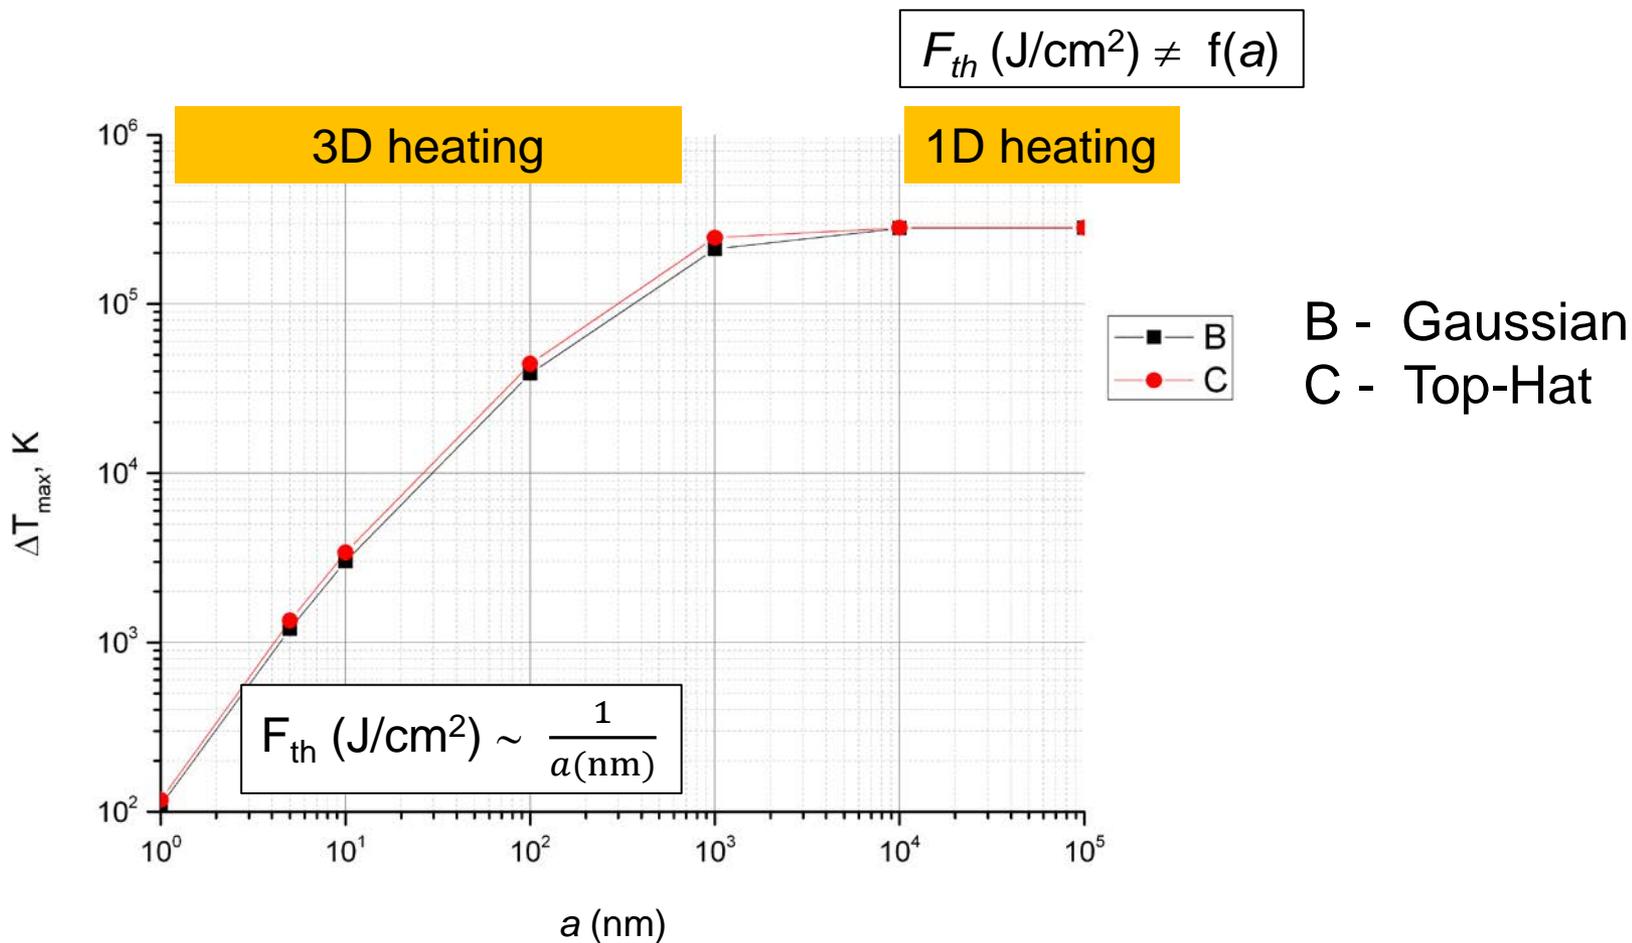

# Analytical solutions in linear approximation

$$\Delta T_{max} \sim A \times F (\text{J/cm}^2) \times \frac{a (\text{nm})}{k (\text{W/mK}) \times \tau (\text{s})}$$

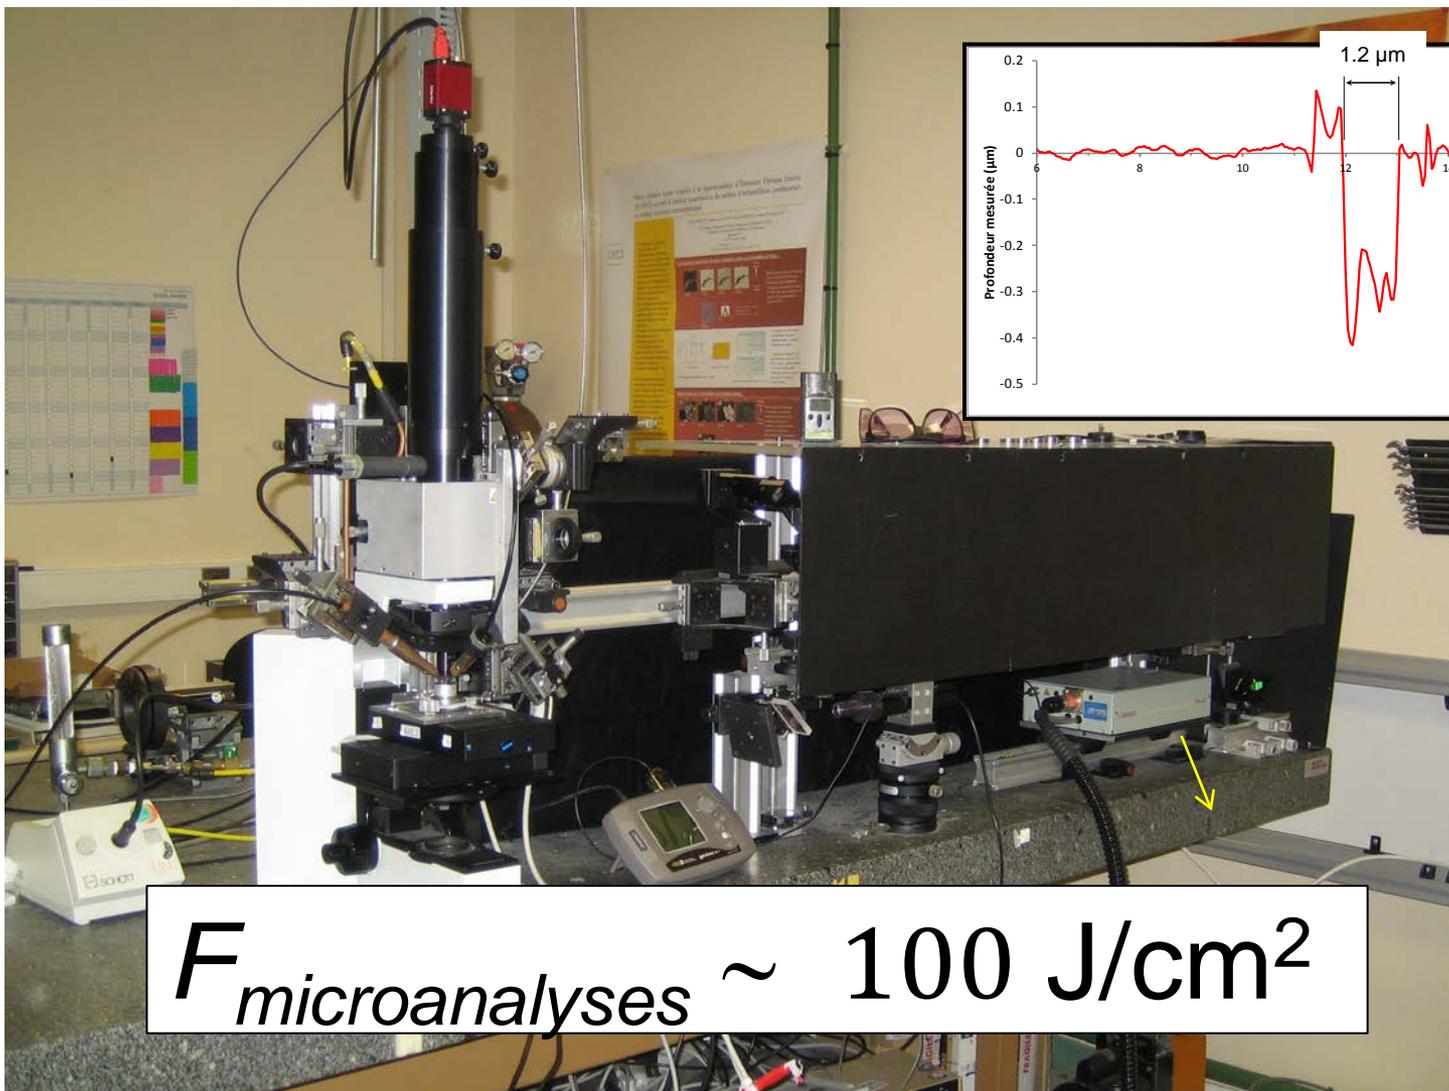

$$\Delta T_{max} \sim A \times F (\text{J/cm}^2) \times \frac{\sqrt{\tau (\text{s})}}{\sqrt{k (\text{W/mK}) \times C (\text{J/m}^3)}}$$

# Nanometric laser ablation

[\*\*\*] C. Jabbour, J.-L. Lacour, M. Tabarant, A. Semerok, F. Chartierc, Development of a tip enhanced near-field laser ablation system for sub-micrometric analysis of solid samples, J. Anal. At. Spectrom., 2016, **31**, 1534–1541

# Normalized curves $T(r)$ for different laser pulse duration $\tau$

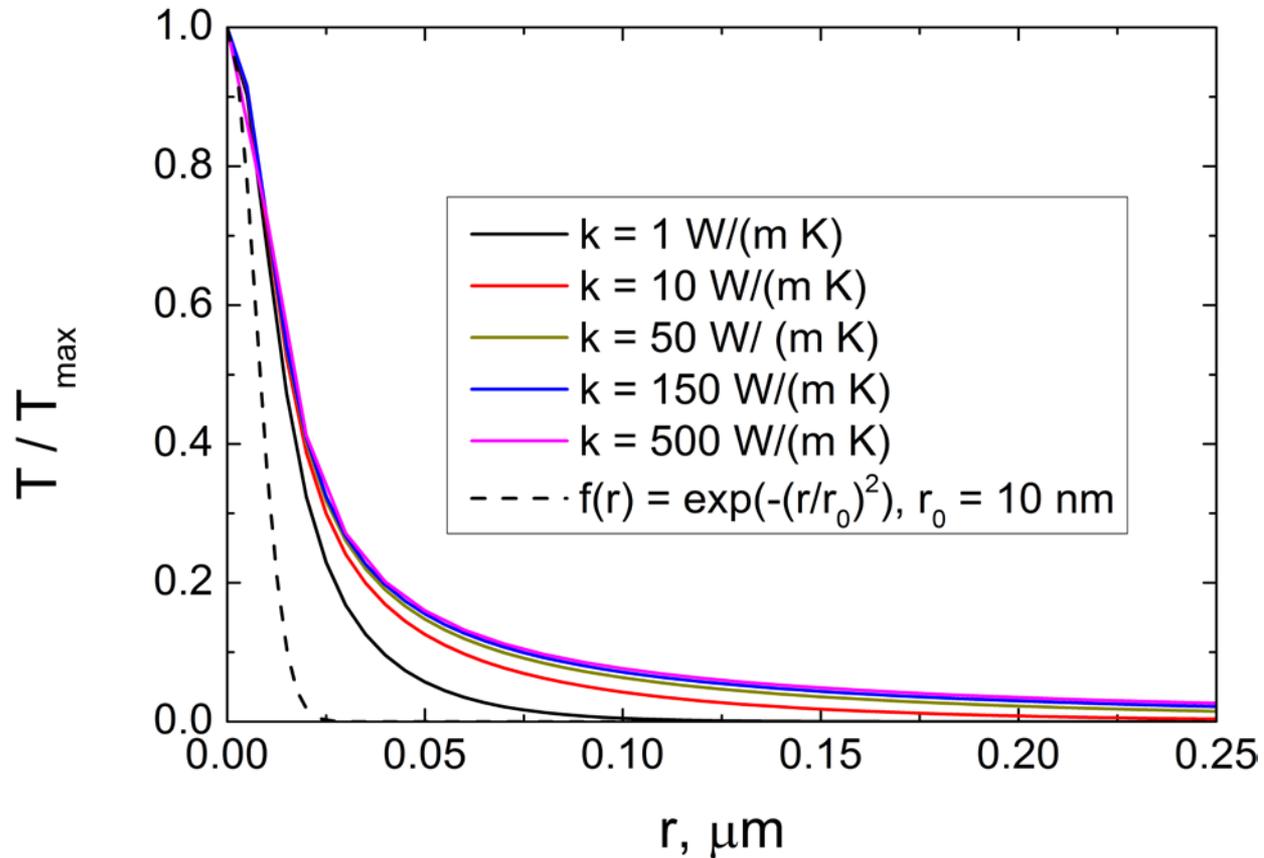

Si,  $\lambda=266$  nm,  $\alpha^{-1} = 5$  nm,  $D_T = 0.8$  cm<sup>2</sup>/s,  $L_T = 20$  nm ÷ 6.0  $\mu$ m,  $2a = 20$  nm

$T = f(r)$  for  $z = 0$  and  $t = \tau_{laser}$

# Normalized curves $T(r)$ for different $k$ (W/m K) (thermoconductivity coefficient)

Si,  $\lambda=266$  nm,  $\alpha^{-1} = 5$  nm,  $L_T = 100$  nm  $\div$  2.0  $\mu$ m,  $2a = 20$  nm

$T = f(r)$  for  $z = 0$  and  $t = \tau_{laser} = 4$  ns

# CONCLUSIONS

- 1) “**Ablation threshold**” depends on laser spot diameter for  $L_T \gg a$ ;
- 2) **Low dependence** of  $T(r, z)/T_{max}$  on  $\tau$  (s) for 3D heating regime;
- 3) **Low dependence** of  $T(r, z)/T_{max}$  on  $k$  (W/m K) for 3D heating regime;
- 4) Possibility to make **nanometric** laser ablation with ns lasers, when  $L_T \gg a$ ;

**Thank you  
for your  
attention**

In LIBS microanalysis, spatial resolution is determined by laser beam diffraction limits (of the order of a laser wavelength) and thermal diffusion of a deposited heating energy during laser pulse duration (proportional to the square root of the pulse duration and matter diffusivity). Being limited by these features of a laser beam and heating energy, the best LIBS spatial resolution (the crater diameter) of 1  $\mu\text{m}$  was obtained by ablation with the laser pulses of 266 nm wavelength and 4 ns duration. One of the ways to improve spatial resolution of microanalysis may be suggested as the use of laser pulses of a lower wavelength ( $< 266 \text{ nm}$ ) and shorter pulse durations (ps and fs).

In the search for the other ways to improve spatial resolution as an important feature of microanalysis, we made laser ablation experiments with a highly localized electromagnetic field obtained by a tip near-field enhancement. In our experiments, a tip of an atomic force microscope was illuminated by the laser pulses of 266 nm wavelength and 4 ns duration. The experiments were followed by extensive multi-parametric theoretical studies to analyze the effect of both matter properties (absorption coefficient, thermal conductivity and capacity) and electromagnetic field parameters (spatial distribution and pulse duration) on the resulted temperature field distribution  $T(r, t)$ . The simulations were made with a home-developed “3D+t” heating model. The simulation results have demonstrated a good agreement with the craters of 100 nm diameters which have been experimentally obtained with Si-, Au- and Ta-samples.

Discussion on the possibilities of application of the ablation with tip near-field enhancement for consecutive chemical analysis with nanometric resolution will be presented.
