HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

"Pyrochemistry" : High temperatures chemical reaction processes

Pyrochemistry

- Molten salt chemistry
 - Liquid metals chemistry

Pyrochemical reprocessing

Can be defined as: set of chemical separations and/or conversion processes avoiding aqueous media.

Pyrochemical processing is, generally, associated to the molten salts media, however molten salts are a sub-set of pyrochemistry.

Zeus or Poseidon, Athens National museum.

Advantages of molten salts for An/Ln separation

High conductivity and large electrochemical window: well adapted for treatment of metallic fuels.

22 den

- Radiation resistance: treatment of high burn-up fuels, or shorter cooling time of spent fuel.
- Simplified management of criticality: compact installations.
- Processes essential for treatment of MSR fuels

Molten salts: ionic liquids

Non ideal behaviour liquids: notion of <u>activity</u> must be considered.

Activity: active concentration. Electrostatic interaction between different species decrease their reactivity potential, thus the concentration must be corrected by introducing an <u>activity coefficient</u>.

- Largely used.
- Eutectic mixture 352°C (41 mol% KCI)
- Working temperature range: 400-550°C
- Anodic limitation: chlorine
- Cathodic limitation: lithium
- Electrochemical window: 3.6 V

Ceaden

First uses of pyrochemistry in the nuclear field

- 1930 First experiment in molten salt to produce metallic Uranium (Manhattan project)
- 1950 ARE project (Aircraft Reactor Experiment):

Molten salt reactor NaF-ZrF₄ -UF₄ (53-41-6 mol%) nuclear propulsion

AIR / ARGON CELL LAYOUT

1960 – MSRE (Molten Salt Reactor Experiment)-LiF-BeF₂ -ZrF₄ -UF₄ (65-30-5-0.1) (molten salt = fuel and heat exchanger) – pyrometallurgic reprocessing

1964 – EBR II (Na reactor, metallic fuel) Pyroreprocessing on site: IFR concept

Séminaire scientifique DRCP « TerraPower Reactor, Molten Salt a

Laboratories dedicated to pyrometallurgy at the CEA Marcoule

Two laboratories dedicated to molten salt chemistry in the Radiochemistry & Processes Department

Alpha laboratory

- Four gloveboxes (under Air or N₂ inert atmosphere)
- Analysis : fluorescence X, alpha and gamma spectrométry , electrochemical studies, in-situ monitoring: LIBS

R&D:

Fundamental and applied studies on pyrochemical separation processes

Three main separation processes:

Precipitation – role of oxoacidity

Electrochemical processes – electrorefining, electrolywining

Reductive liquid-liquid extraction

Ceaden Separation processes in molten salts: Precipitation

AIDA-Mox process

Conversion of military Pu into non military PuO₂

- Starting alloy: Pu, Ga (<5 wt%) and ²⁴¹Am (<1 wt%) (coming from ²⁴¹Pu activity)
- NaCl-KCl salt at 700°C

Figure 1 : Pyrochemical conversion of Pu-Ga alloy into PuO2

Gas/other

Precipitation

Precipitate

Alloy chlorination: Pu(IV), Am(III), GaCl₃ volatile
 Selective precipitation of PuO₂ by bubbling O_{2(g)}, Am(III) remains soluble

A.G. Osipenko et al, Molten Salt Forum, vol.5-6, 553 (1997)

Ceaden Separation processes in molten salts: Precipitation

E-pO²⁻ Diagram of Pu in LiCl-KCl at 450°C, [Pu(III)]=0.01mol/kg, et à 0.001mol/kg pour l'Am

Pu: C. Caravaca et al., J. Nucl. Mat., 377, 340 (2008), Am: D. Lambertin et al., Plasma and ions., 3, 65-72 (2000)

Three main separation processes:

Precipitation – role of oxoacidity

Electrochemical processes – electrorefining, electrolywining

Reductive liquid-liquid extraction

Electrodeposition

Industrial pyrometallurgical processes

Industrial uses of molten salts

Aluminium production ~24 Mt/year

Alkali Metals sodium ~ 100 kt/year

Alumina Electrolysis in molten cryolite (Na₃AIF₆) at 950°C

Pool AP30 (Alcan) : 14m length, ~300kA, Far. Yeald = 96%, 2,3t/d Electrolysis of alcali chlorides. Ex: production of sodium at 600°C $(2NaCl = 2Na + Cl_2)$

Pool Down : charge 8t, 45 kA, Far. yeld = 90%, 0,8t/j (Na), 1,3t/j (Cl₂) Electrolysis of 2HF,KF at ~85-105°C $(2HF_{liq} = H_2 + F_2)$

Monel pool: porous carbone anode, steel cathode, 6 kA, Far. yeld = 90-95%, 4kg/h (F₂)

Other metals (Mg, Ca, Li, Zr...)

Ceaden Nuclear applications : Electrorefining process

Purification process: anodic dissolution of impure metal and cathodic deposition of purified metal

Nuclear applications: Reprocessing of metallicfuels

EBR-II

U deposit

- Most adapted process for metallic fuel recycling (US, Japan, South Korea, Russia, India)
- Analogue process for nitride fuels (Japan, Russia)

Table I. Inventory of Spent Fuel Designated for Pyroprocessing at INL.					
Fuel Type	EBR-II Driver (MTHM)	FFTF Driver (MTHM)	EBR-II Blanket (MTHM)	Total (MTHM)	
Initial Fuel in June 1996	3.1	0.25	22.4	25.75	
Fuel Treated as of January 2012	0.8	0.22	3.6	4.62	
Remaining Untreated Fuel	2.3	0.03	18.8	21.13	

Influence of thermodynamic on electroseparation

Electrochemical processes

Ceaden

Nernst equation, equilibrium

 $Ox + ne^{-} \rightarrow Red$

$$E_{eq}(An^{n+} / An) = E^{\circ}(An^{n+} / An) + \frac{2.3RT}{nF} \log\left(\frac{a(An^{n+})}{a(An)}\right)$$

$$E_{eq}(An^{n+} / An) = E^{\circ}(An^{n+} / An) + \frac{2.3RT}{nF} \log\left(\frac{\gamma_{An^{n+}}}{\gamma_{An}}\right) + \frac{2.3RT}{nF} \log\left(\frac{x_{An^{n+}}}{x_{An}}\right)$$

$$- \underline{\text{Use of inert solid electrode (deposition of pure An, a(An)=1)}$$

$$E_{eq}(An^{n+} / An) = E^{\circ}(An^{n+} / An) + \frac{2.3RT}{nF} \log(\gamma_{An^{n+}}) + \frac{2.3RT}{nF} \log(x_{An^{n+}})$$

$$An/\text{Ln separation depends on } \Delta E$$

$$= E^{\circ}(An^{n+} / An) + \frac{2.3RT}{nF} \log(x_{An^{n+}}) \xrightarrow{\Rightarrow E^{\circ} \text{ apparent standard potential } Determined by electrochemical measurments}$$

 $\stackrel{\text{\tiny $\&$}}{\to}$ Electrodeposition of metal: more cathodic potential compared to E_{eq} (= more negative than E_{eq})

Den Influence of thermodynamic on electroseparation

On inert electrode

On non-inert electrode

♦ Pure An deposit

Subscription of solubilised in metal or intermetallic formation

γ ratio in metal may be very important

Activity coefficient in metal

- Determination of activity coefficient in metal
 - Galvanic Cell: An | molten salt, AnCl₃ | An_(Me)

Ceaden

LiCl-KCl-PuCl₃, Bi electrode at 500° C

Electromotive force (e.m.f.) :

 $f.e.m = E_{An} - E_{An(Me)} = \frac{2.303RT}{nF} \log(\gamma_{An(Me)}) + \frac{2.303RT}{nF} \log(x_{An(Me)})$

✤ Measurement does not depend on electrolyte

Ceaden Activity coefficient in metal

Inert cathode / reactive cathode

Inert

-1

- Liquid cathode: solubilisation of An in metal
- Solid reactive cathode: intermetallic formation

$$\gamma_{An}=1$$

 $\gamma_{An}\neq 1$ (Cd, Bi)
 $a_{An}\neq 1$

Example : $log\gamma(Pu_{(Bi)})=-8,7$ at 550°C

Inert cathode: high An/Ln separation, but deposit may be difficult to stabilise on cathode

Liquid cathode: lower separation but stabilisation of species in liquid metal.

Ceaden Applications at the CEA: Salt cleaning

Exhaustive electrolysis or electrowinning (FP7 - SACSESS)

Key step of the process: salt coming from E. ref step still contain An

 \rightarrow Necessity to recover these An

First electrolysis realised on simulated electrorefining salt baths

Anode \rightarrow production of Cl_{2(g)}

(first tests on lanthanides at the inactive laboratory)

Understanding of the electrolysis behaviour:

- > determination of faradic yelds, characterisation of the obtained deposit at the cathode,
- > optimisation of Cl_2 producing anode,
- influence of the cathode material (AI, Mo)

Active tests on salts containing actinides (Pu) and lanthanides (Ce)

→ An/Ln Separation

Three main separation processes:

Precipitation – role of oxoacidity

Electrochemical processes – electrorefining, electrolywining

Reductive liquid-liquid extraction

Liquid-liquid extraction

Principe

cea den

$$MX_{y \text{ (salt)}} + y/z R_{(metal)} = M_{(metal)} + y/z RX_{z \text{ (salt)}}$$

R: reductive metal dissolved in a Metallic solvent

$$\boldsymbol{\mathcal{K}} = \frac{\boldsymbol{a}_{M} \boldsymbol{a}_{RX_{z}}^{y/z}}{\boldsymbol{a}_{MX_{y}} \boldsymbol{a}_{R}^{y/z}} \qquad \begin{cases} a_{\text{Salt}} = X_{\text{Salt}} * \gamma_{\text{Salt}} \\ a_{\text{MS}} = X_{\text{MS}} * \gamma_{\text{MS}} \end{cases}$$

Important parameters:

In general, **molar** fractions (thermo) or wt% (exp.)

• Example :
$$PuF_3 + 3Li_{(Bi)} = Pu_{(Bi)} + 3LiF$$

 $D_{Pu} = x_{Pu(Bi)} / x_{PuF3}$
 $S_{Pu/Nd} = D_{Pu} / D_{Nd}$

Example

laden

Pu/Nd separation by Al, in LiF-AIF₃
PuF₃ + Al = Pu_(Al) + AIF₃
K_{Pu} = $\frac{a_{Pu(Al)}a_{AIF_3}}{a_{PuF_3}a_{Al}} = \frac{\gamma_{Pu(Al)}x_{Pu(Al)}\cdot\gamma_{AIF_3}\cdot x_{AIF_3}}{\gamma_{PuF_3}\cdot x_{PuF_3}}$ D_{Pu} = $\frac{x_{Pu(Al)}}{x_{PuF_3}}$ Nd: NdF₃ + Al = Nd_(Al) + AIF₃
K_{Pu} = $\frac{a_{Nd(Al)}a_{AIF_3}}{a_{NdF_3}a_{Al}} = \frac{\gamma_{Nd(Al)}\cdot x_{Nd(Al)}\cdot \gamma_{AIF_3}\cdot x_{AIF_3}}{\gamma_{NdF_3}\cdot x_{NdF_3}}$ D_{Nd} = $\frac{x_{Nd(Al)}}{x_{NdF_3}}$ Separation factor can be expressed from previous equations:

$$SF_{Pu/Nd} = rac{D_{Pu}}{D_{Nd}}$$

$$\log SF_{Pu/Nd} = \log\left(\frac{K_{Pu}}{K_{Nd}}\right) + \log\left(\frac{\gamma_{Pu^{3+}}}{\gamma_{Nd^{3+}}}\right) + \log\left(\frac{\gamma_{Nd(Al)}}{\gamma_{Pu(Al)}}\right)$$

Liquid / liquid extraction

Electrolysis

cea den

$$\Delta E_{An/Ln} = \Delta E^{\circ}_{An/Ln} + \frac{2,3RT}{nF} \log \left(\frac{x_{An^{n+}}}{x_{Ln^{n+}}} \cdot \frac{x_{Ln(Me)}}{x_{An(Me)}} \right) + \frac{2,3RT}{nF} \log \left(\frac{\gamma_{An^{n+}}}{\gamma_{Ln^{n+}}} \right) + \frac{2,3RT}{nF} \log \left(\frac{\gamma_{An(Me)}}{\gamma_{An(Me)}} \right)$$

Pu/Ce Separation— activity coefficient dependency

Comparison of activity coefficients in different metallic solvents

Pyrometallurgic processes are complementary with hydrométallurgic processes regarding several aspects → Treatment of particular fuels combustibles (metallic, MSR)

→ Possible developments of hybrids hydro/pyro processes (ex : Russia)

At the CEA Marcoule: Two processes studied

Liquid/liquid reductive extraction process:

- Development of the core of process
- System studies
- Applications to treatment of inert matrices being investigated

Electrochemical separation process:

- Studies focussed on key steps of the electrorefining process
 - Applications on recovery of strategic metals
