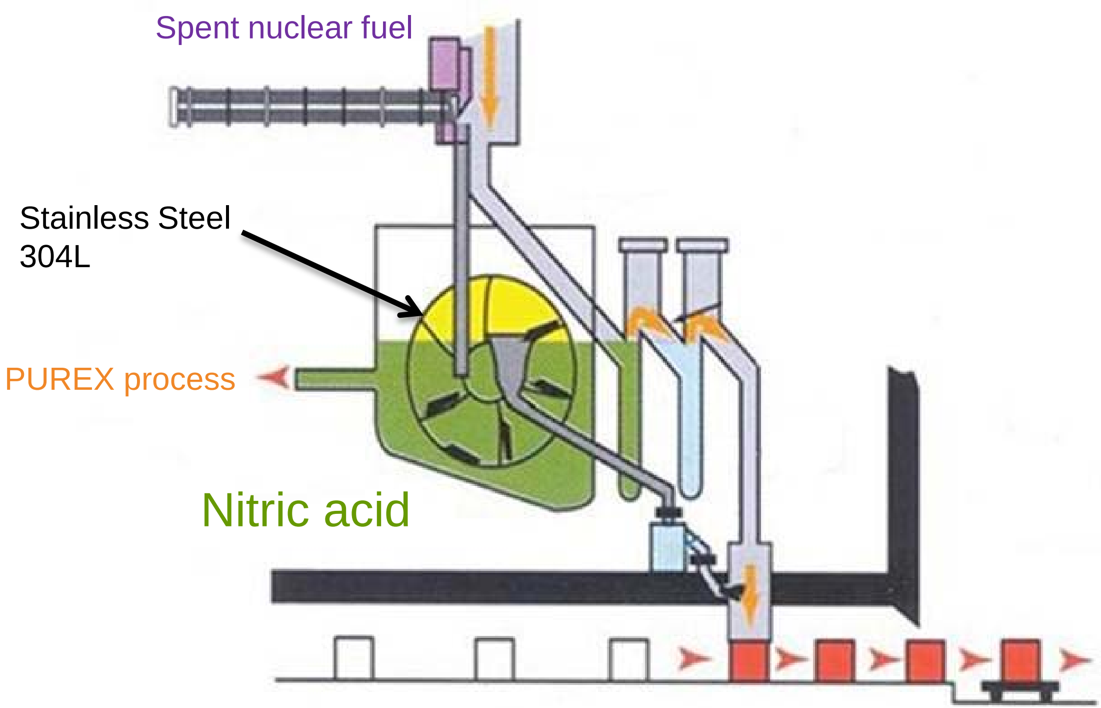
EIS 2016

INDUSTRIAL CONTEXT

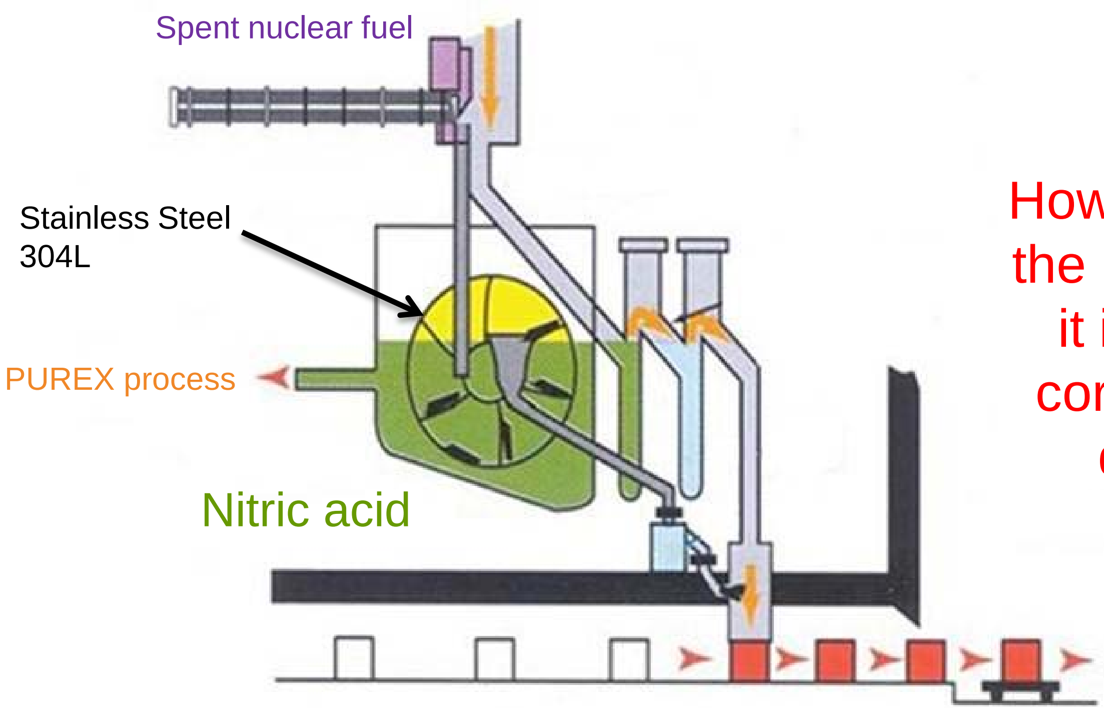
- Spent nuclear fuel reprocessing
  - Concentrated nitric acid environment
  - Use of stainless steel as materials for containing concentrated nitric acid (passive materials with good corrosion/dissolution resistance in oxidizing media)



Areva La Hague

INDUSTRIAL CONTEXT

- Spent nuclear fuel reprocessing
  - Concentrated nitric acid environment
  - Use of stainless steel as materials for containing concentrated nitric acid (passive materials with good corrosion/dissolution resistance in oxidizing media)



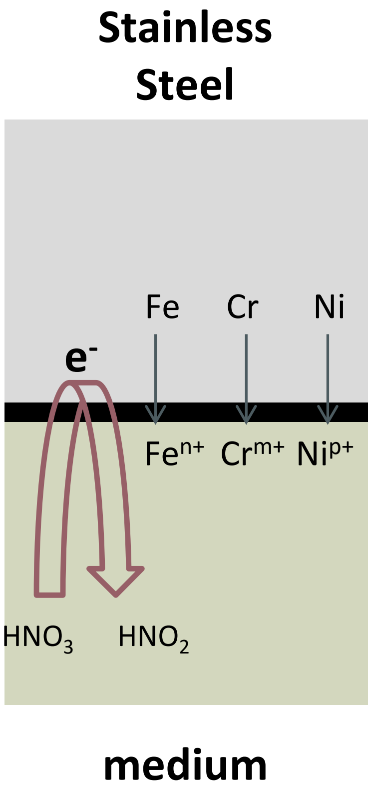
Areva La Hague

However, for the prediction of the lifetime of the equipment, it is essential to know the corrosion mechanisms and quantify their kinetics.

ISSUES

Why do we need to understand cathodic processes in nitric acid solution?

- **Anodic process**: oxidation of material
- **Cathodic process**: medium reduction

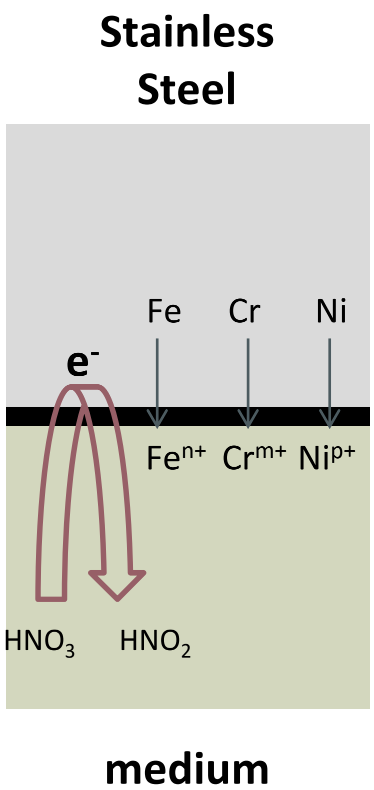


4 to 8 M HNO3 → highly concentrated acidic solution
→ oxidizing media

ISSUES

Why do we need to understand cathodic processes in nitric acid solution?

- **Anodic process**: oxidation of material
- **Cathodic process**: medium reduction

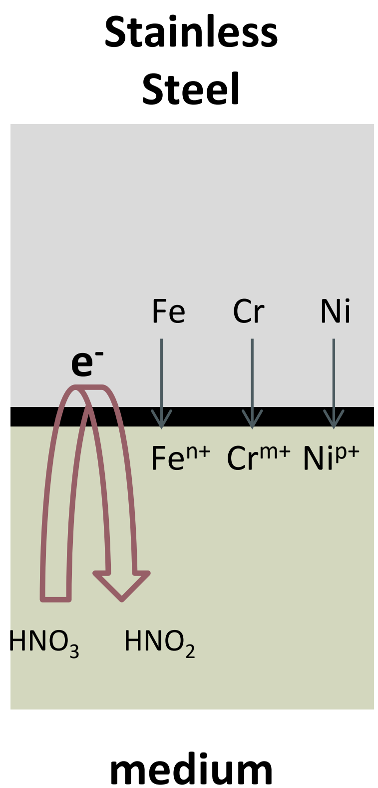


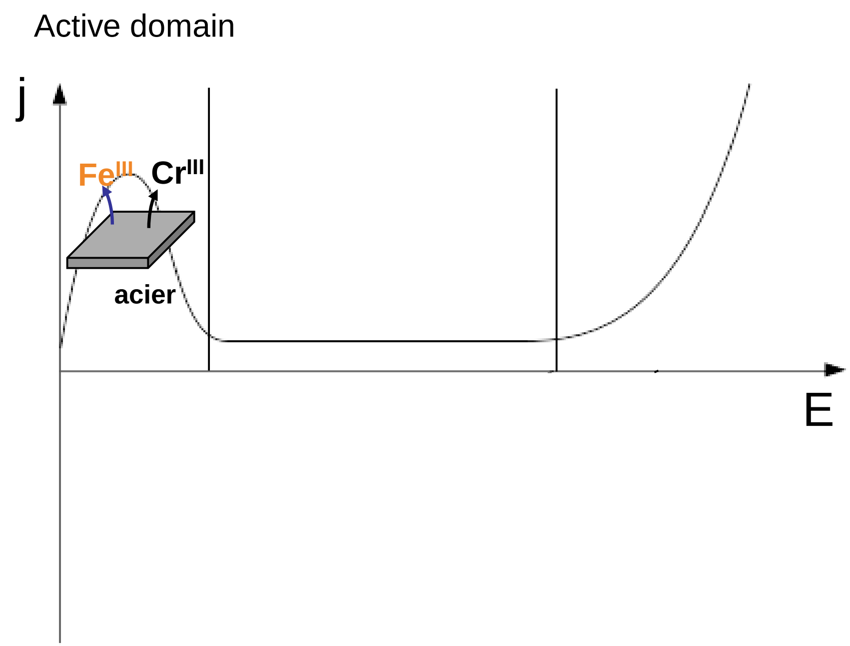
The kinetics of these two processes can be characterized by their current density

4 to 8 M HNO_3 → highly concentrated acidic solution
→ oxidizing media

Why do we need to understand cathodic processes in nitric acid solution?

- **Anodic process**: oxidation of material
- **Cathodic process**: medium reduction





4 to 8 M HNO_3 → highly concentrated acidic solution
→ oxidizing media

[E. Tcharkhtchi et al., Corrosion Science, 2016]

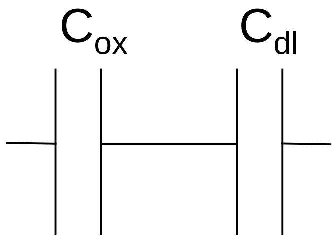
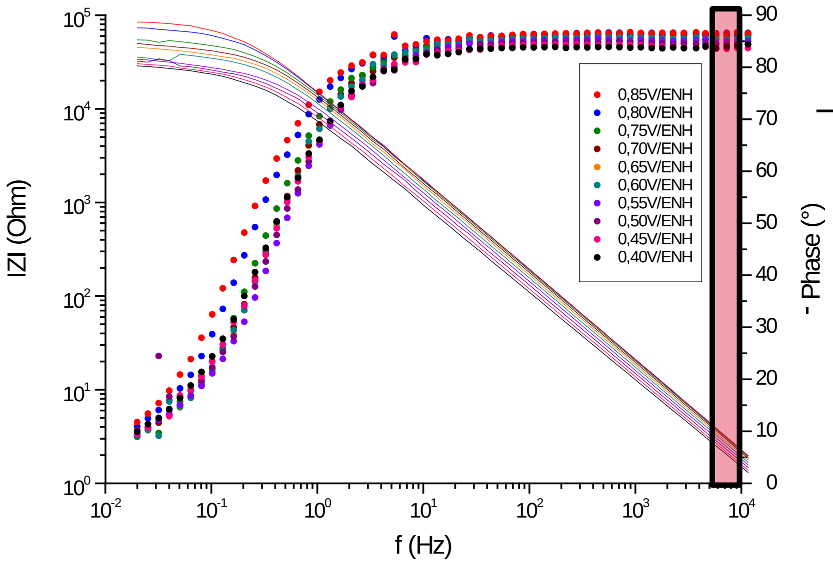
At infinite frequencies:

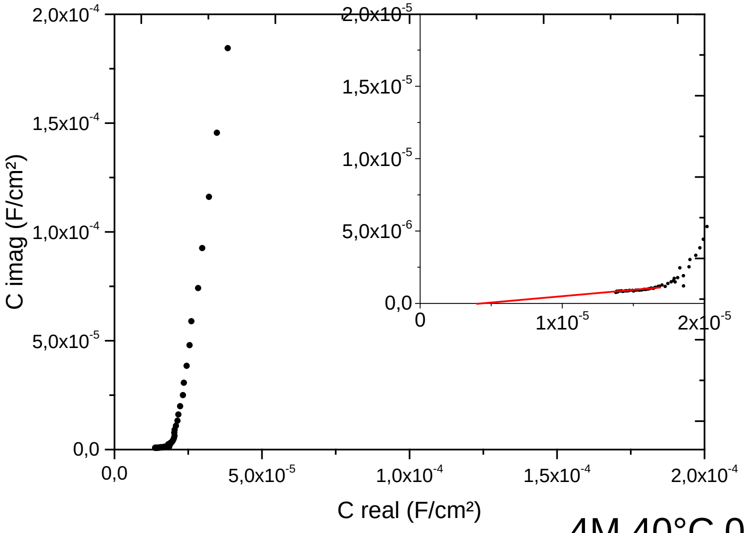


KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L: HF DOMAIN

Bode representation:



Cole & Cole representation:



4M 40°C 0.85 V/ENH

At infinite frequencies:

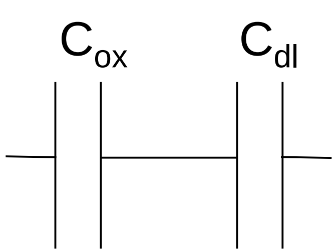
By extrapolation: $C_\infty = 4.1\ 10^{-6}$ F.cm^{-2}



If we consider this value as the capacitance of the oxide we can calculate its thickness:

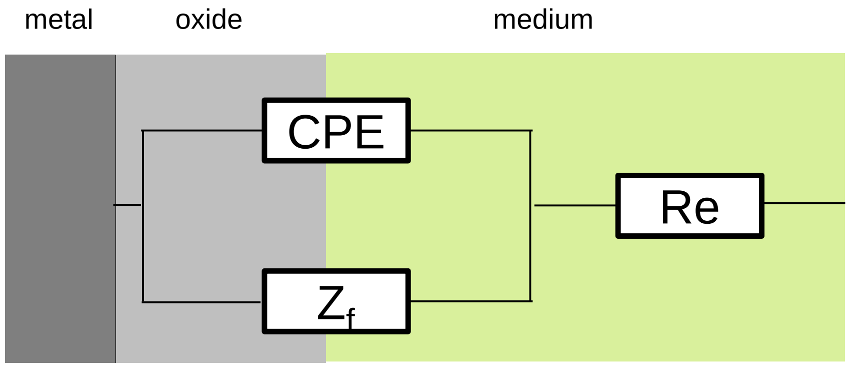
$$d = \frac{\varepsilon\varepsilon_0}{C_\infty} = 2.6 \text{ nm}$$

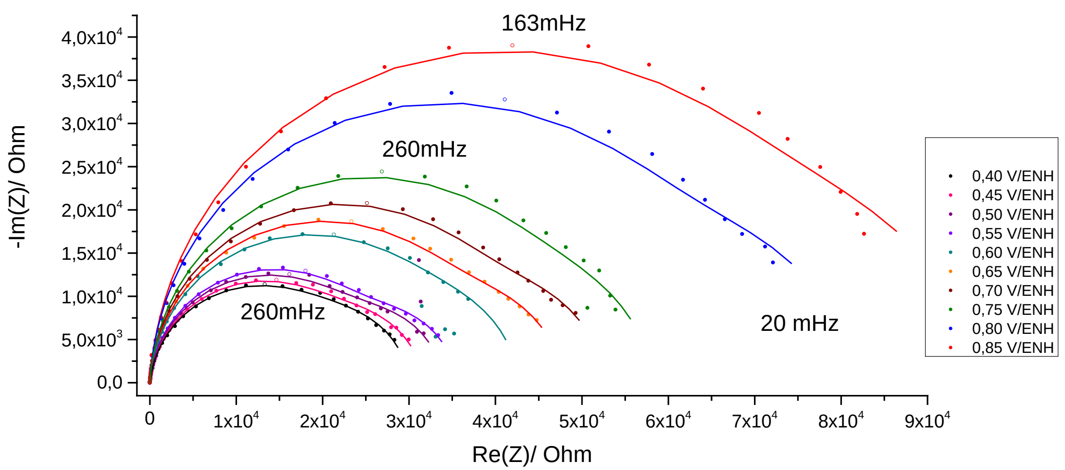
By XPS: d = 3 nm

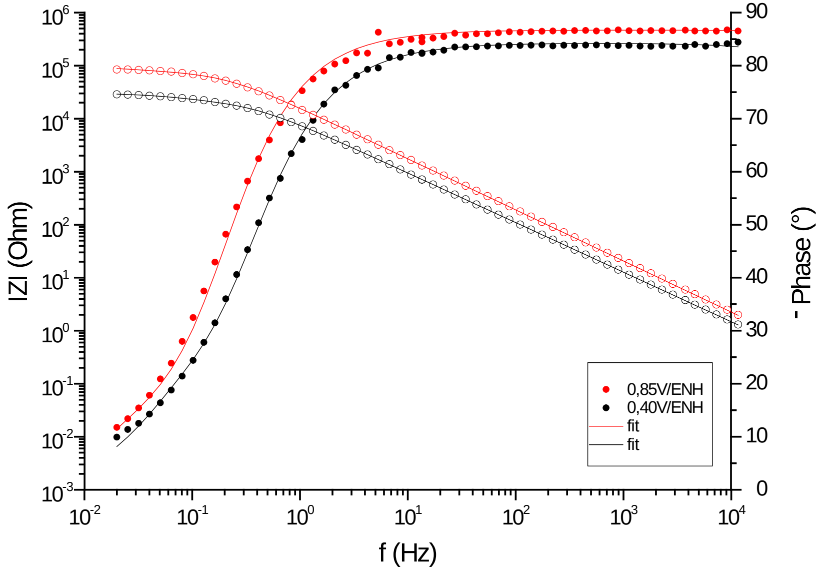
Assuming C_{dl} 30 µF.cm^{-2}, d = 2.2 nm

[M.Benoit et al., Electrochemica Acta, 201, 2016]

KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L: CIRCUIT EQUIVALENT PARAMETERS







→ Good fit for all potentials

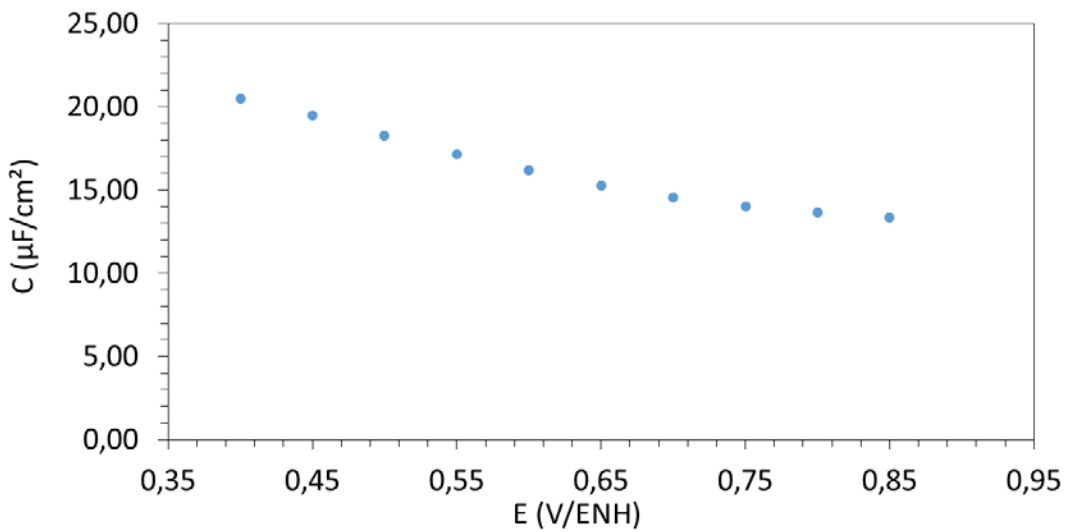
KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L: CPE

For CPE parameters we used Brugg's formula to obtain capacitance values:

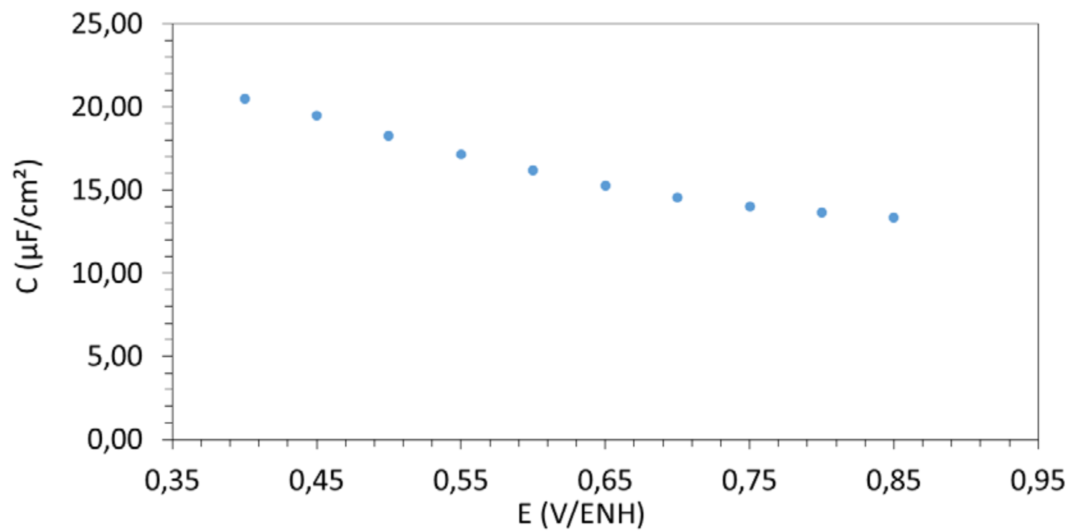
$$C_{eff} = Q^{1/\alpha} R_e^{(1-\alpha)/\alpha}$$



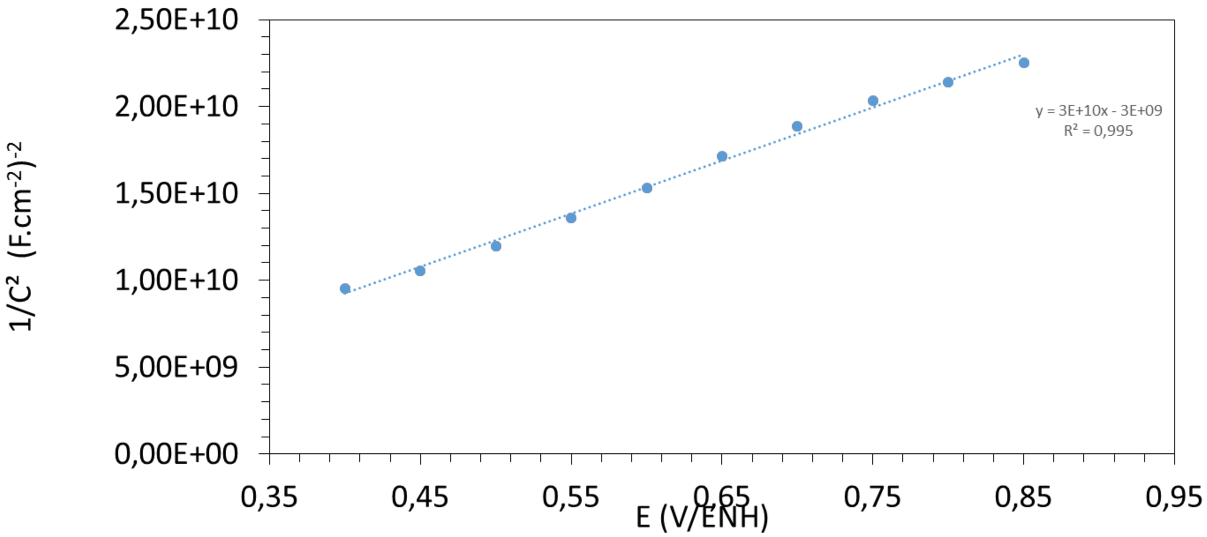
KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L: CPE

For CPE parameters we used Brugg's formula to obtain capacitance values:

$$C_{eff} = Q^{1/\alpha} R_e^{(1-\alpha)/\alpha}$$



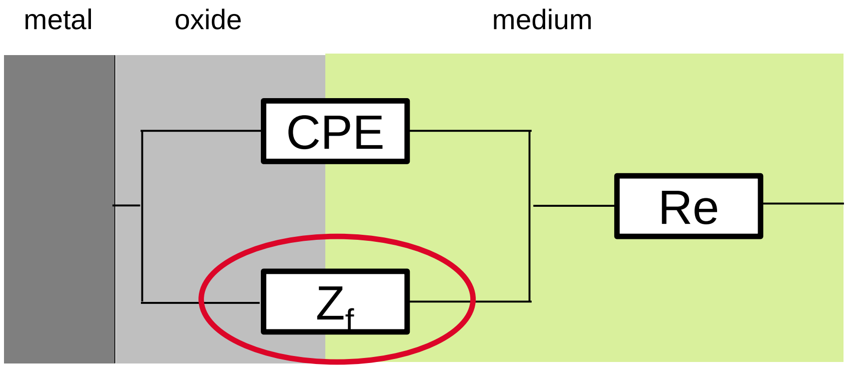
→ Verification of Mott Schottky's law



$$\frac{1}{C_{SC}^2} = \frac{2}{\varepsilon \varepsilon_0 q_e N_0}\left(E - E_{bp} - \frac{k_B T}{q_e}\right)$$

$N_0 = 1{,}5.10^{21}$ cm^{-3}

KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L: FARADAIC PROCESSES



$HNO_{2,sol} \xrightarrow{k_1} HNO_{2,ads}$ $\qquad k'_1 = k_1[HNO_2]$

$HNO_{2,ads} + e^- + H^+ \xrightarrow{k^\circ_2} NO_{ads} + H_2O$ $\qquad k'_2 = k_2^\circ a_H e^{(b_2(E-E^\circ))}$

$NO_{ads} + \frac{1}{2}H^+ + \frac{1}{2}NO_3^- + \frac{1}{2}H_2O \xrightarrow{k_3} \frac{3}{2}HNO_2$ $\qquad k'_3 = k_3\sqrt{a_N a_e a_H}$

Stationary solutions:

$$\theta_{1S} = \frac{k'_1}{k'_1 + \frac{k'_2 . k'_1}{k'_3} + k'_2 . \beta} \qquad \theta_{2S} = \frac{k'_2}{k'_3}\theta_{1S}$$

Non stationary solutions:

$$\frac{\Delta\theta_1}{\Delta E} = \frac{-k'_2 . b_2 . \beta . \theta_{1S} - \left(\frac{k'_1 . k'_2 . b_2 . \theta_{1S}}{j\omega + k'_3}\right)}{j\omega\beta + k'_1 + k'_2 . \beta + \frac{k'_2 . k'_1}{j\omega + k'_3}} \qquad \frac{\Delta\theta_2}{\Delta E} = \frac{k'_2 . b_2 . \theta_{1S} + k'_2 . \frac{\Delta\theta_1}{\Delta E}}{j\omega + k'_3}$$

Impedance:

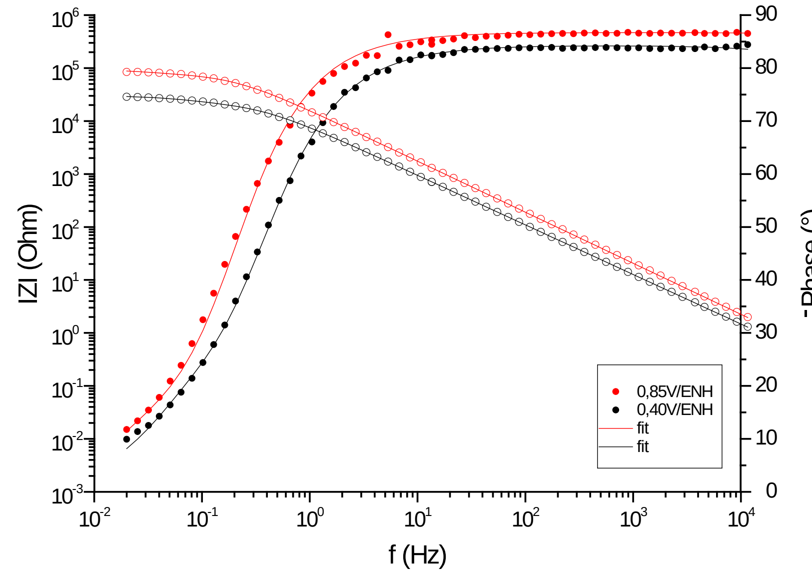
$$\boxed{\frac{1}{Z_f} = -FS\left(k'_2 . \beta . \frac{\Delta\theta_1}{\Delta E} + k'_2 . b_2 . \beta . \theta_{1S}\right)}$$

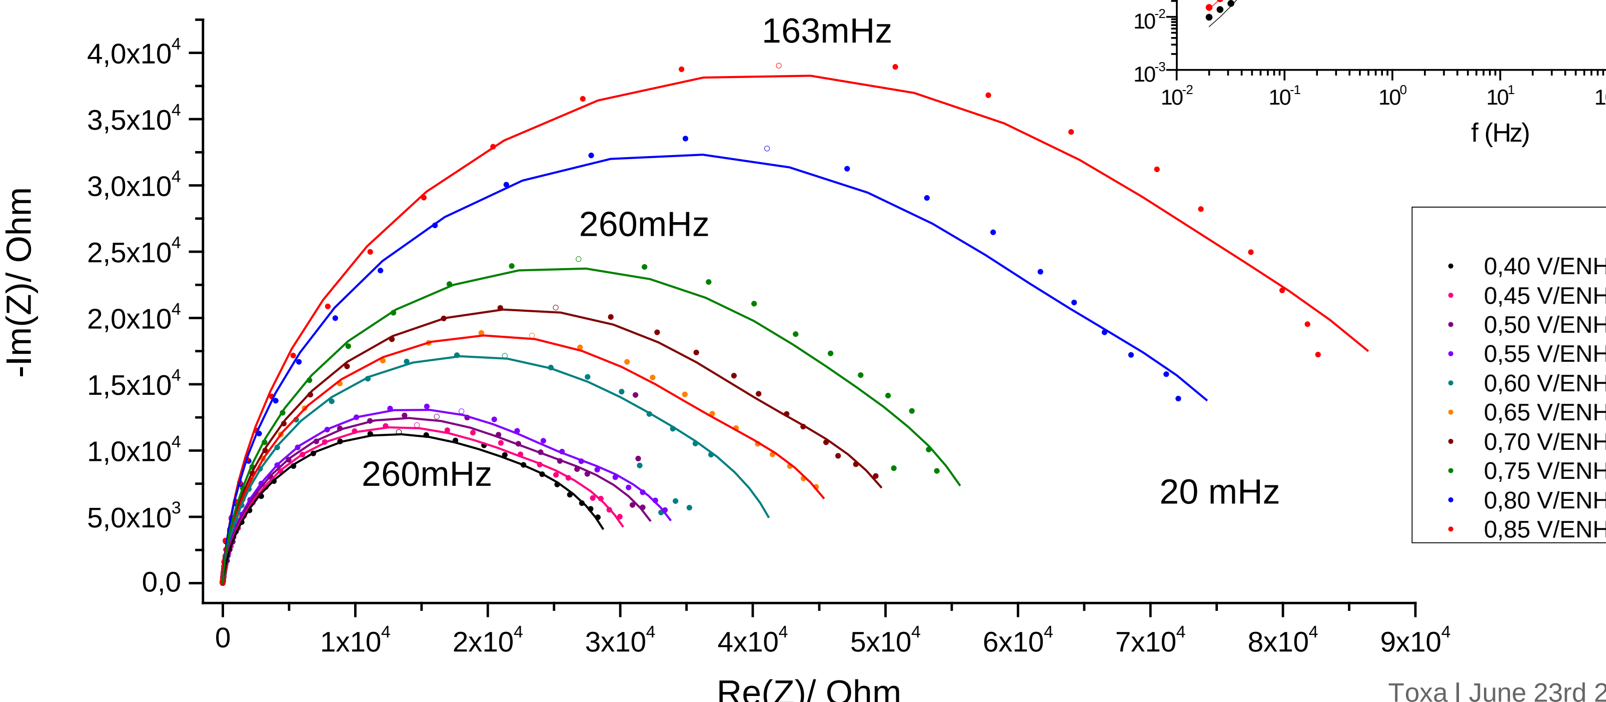
KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L: FARADAIC PROCESSES

→ Fitted kinetic constants:

$k_1 = 0.03 \pm 0.02\ cm.s^{-1}$
$k°_2 = 6.10^{-4} \pm 2\ 10^{-4}\ s^{-1}$
$[k_3 = 2\ 10^{7}\ s^{-1}]$

On Gold [3] : $k_1 = 1.10^{3}\ cm.s^{-1}$
$k°_2 = 1.10^{5}\ s^{-1}$
$k_3 = 1.10^{7}\ s^{-1}$



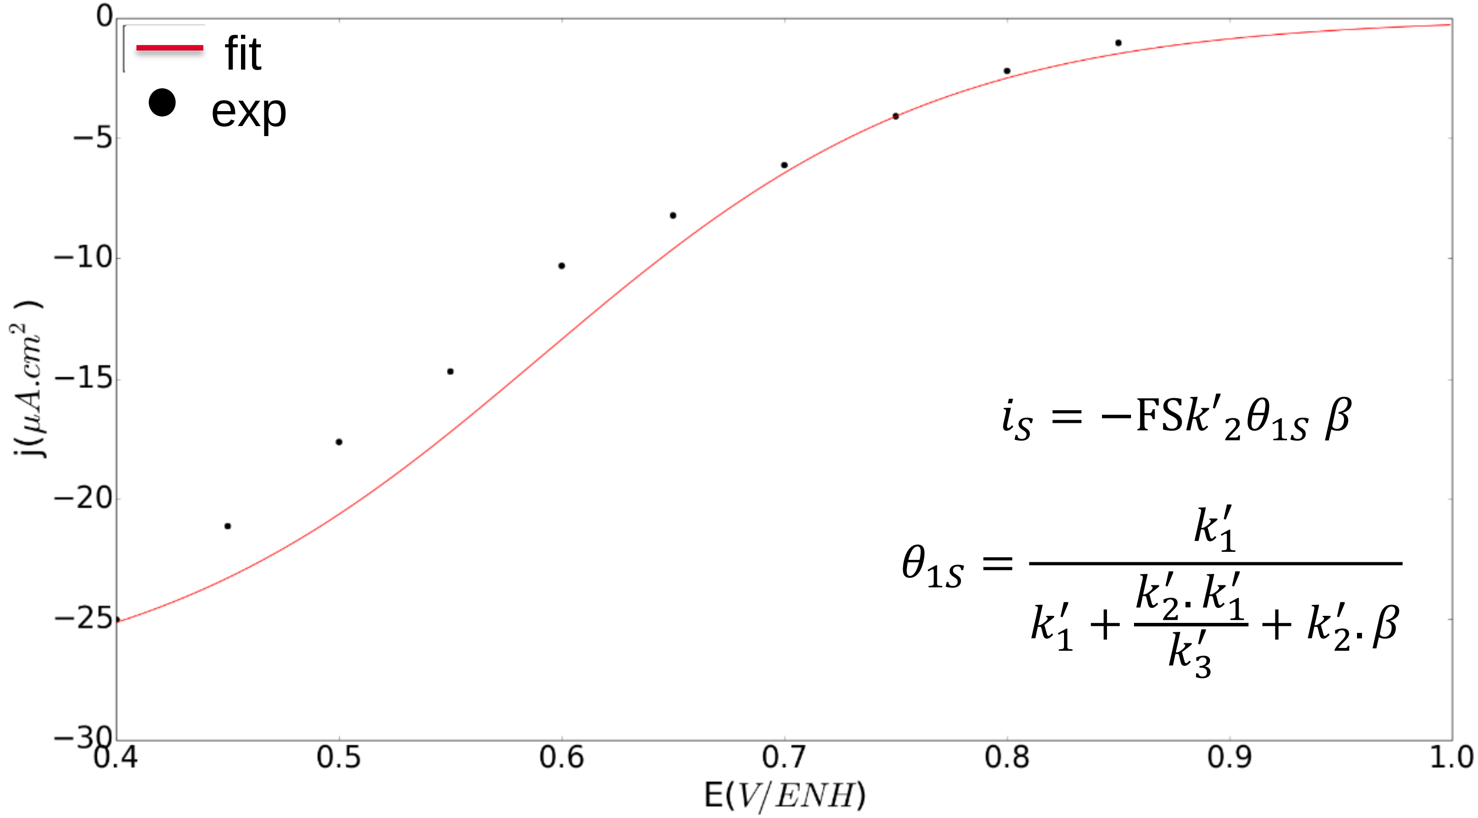


[3] [R. Lange et al., Electrochem. Com. 2013]

KINETICS OF NITRIC REDUCTION ON STAINLESS STEEL 304L

Kinetic constants validated by stationary current (4M 40°C):

Constants used:
k_1= 0,03 $cm.s^{-1}$
$k°_2$= 6.10^{-4} s^{-1}
k_3= 2.10^{6} s^{-1}



$$i_S = -\mathrm{FS}k'_2\theta_{1S}\,\beta$$

$$\theta_{1S} = \frac{k'_1}{k'_1 + \frac{k'_2.k'_1}{k'_3} + k'_2.\beta}$$

CONCLUSIONS & OUTLOOK

- On stainless steel:
  - Same mechanism as on gold
  - Conversely to gold electrode, the autocatalytic processes play a minor role
  - Oxide layer slows down kinetics reduction
  - Oxide layer properties can be obtained by EIS (thickness & dielectrics properties)
  - Kinetic constants have been determined and verified by modelling of stationary current
- To go further: fitting in progress for other experimental conditions

Thank you for your attention
