**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Transport in Fusion Plasmas: Is the Tail Wagging the Dog?

**#1:** edge transport: new light on “shortfall” conundrum

**#2:** spontaneous confinement transition @separatrix

G. Dif-Pradalier<sup>1</sup>, Ph. Ghendrih<sup>1</sup>, Y. Sarazin<sup>1</sup>, F. Widmer<sup>2</sup>, Y. Camenen<sup>2</sup>,  
X. Garbet<sup>1</sup>, C. Gillot<sup>1</sup>, V. Grandgirard<sup>1</sup>, L. Vermare<sup>3</sup>

<sup>1</sup>CEA, IRFM, France

<sup>2</sup>Aix Marseille Université, France

<sup>3</sup>LPP, Ecole Polytechnique, France

Ackn.: Festival de Théorie, Aix-en-Provence

- ▶ spontaneous transitions come in many flavours: ITBs,  $\{H; I; \dots\}$ -modes
- ▶ common grounds: **turbulence** & self-reinforcing feedback
  - onset of differential rotation
  - steepening of  $\nabla p_i$
  - electric field well (or hill)  $\rightarrow$  shear-induced bifurcation [Biglari PF 90, ...]
- ▶ robustly observed (Tokamak, stellarator, ...) upon modifications of edge/SOL operating **boundary conditions**

Global impact of localised boundary interactions is a classical problem

- fluids: Prandtl ; swirling flows [torque vs. velocity [Saint-Michel PRL 13]]  $\leftrightarrow$  **forcing**
- MFE: upstream [core & edge] impact of magn. connection to bound. [SOL/wall]  
*[known importance of wall conditioning, recycling, etc.]*

take a step back  $\rightarrow$  focus on **low-confinement "L-mode" edge**

$\hookrightarrow$  **prerequisite** to understand **edge bifurcation(s)**

[Spoiler:  $\text{interplay SOL} \leftrightarrow \text{edge} \leftrightarrow \text{core}$ ]

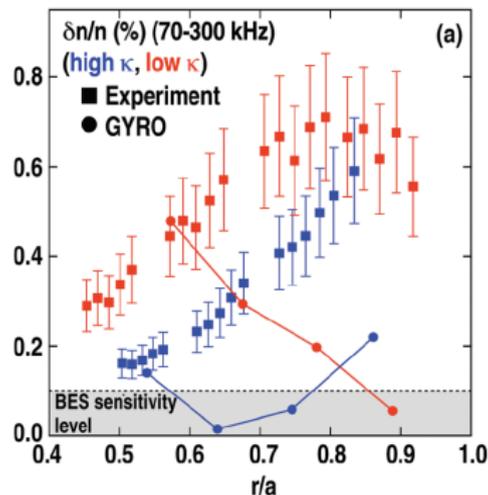

➤ Several (related) conundrums

① intrinsic problem [shortfall?] @plasma edge?

↳ edge often **linearly stable**

↳ where does edge turb. come from?

↳ propagation/contamination?

[Holland PoP 11]

➤ Several (related) conundrums

① intrinsic problem [shortfall?] @plasma edge?

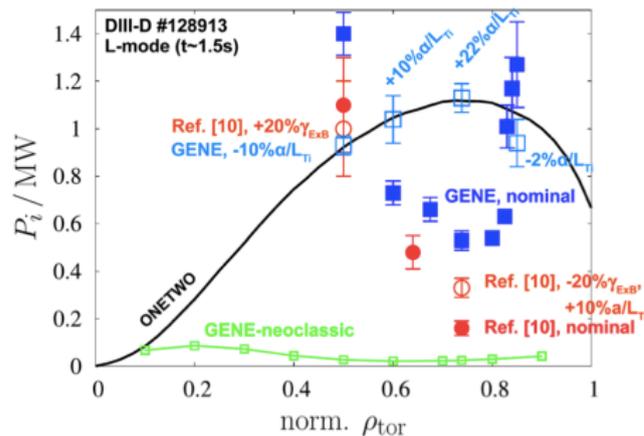

↳ edge often **linearly stable**

↳ where does edge turb. come from?

↳ propagation/contamination?

② important turb. properties:  
 all **locally-determined**?

③ what presides over the onset of edge transport barrier? Mechanism(s)?

[Gorler PoP 14]

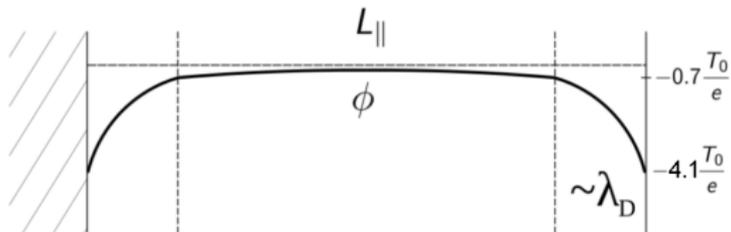

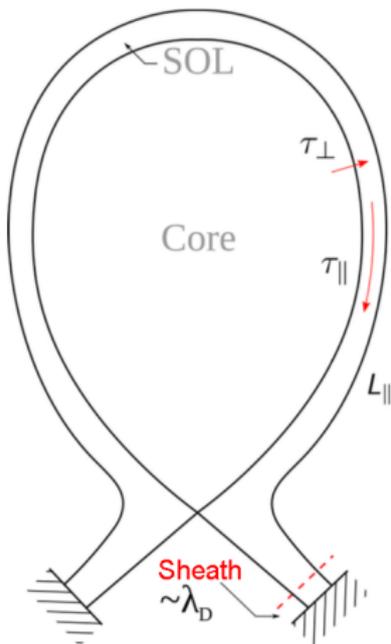

- equil. gradient length  $\sim$ (few  $\rho_i$ )  $\Rightarrow$  **scale separations debatable** in edge  
(gradient scale  $\leftrightarrow F_{eq}$ )  $\not\Rightarrow$  (turb.scale  $\leftrightarrow \delta f \equiv F - F_{eq}$ )
- profiles  $\equiv$  **large uncertainties** in edge; **poorly known** in SOL  
 $\hookrightarrow$  **flux-driven** desirable  $\left\{ \begin{array}{l} \Rightarrow$  propagation of information on **global scales** \\ \Rightarrow add. **symm.-breaking mechanisms** edge turb. \end{array} \right.
- magnetic connection to **material boundaries**  
 $\hookrightarrow$  expect  $E_r$  shear ( $\nabla p/n$  vs.  $-\nabla T_e$ )  $\Rightarrow$  incidence on **transp. barrier onset?**

► this work: global organisation core  $\leftrightarrow$  edge  $\leftrightarrow$  SOL? [Spoiler: strong interplay]

① **whereby edge transitions to / sustains a turbulent state?**

② **spontaneous transport barrier @separatrix**

$\hookrightarrow$  mechanisms whereby such bifurcations occur? causality?

$$\Delta\phi^{\text{sheath}} \underset{\substack{\uparrow \\ \text{fluid}}}{\approx} \frac{T_e}{e} \frac{1}{2} \ln \left[ \frac{m_e}{m_i} \left( 1 + \frac{T_i}{T_e} \right) \right] \underset{\substack{\uparrow \\ \text{(D)}}}{\approx} -4.1 \frac{T_e}{e}$$

[eg. Stangeby 2000]

### Path followed:

simplified SOL physics within flux-driven GK...  
...without resolving sheath (subgrid) & neutrals

- ▶ simplified limiter geom.
- ▶ simplified adiabatic electron response

- ▶ penalised approach
- |   |
|---|
| • $F_s \rightarrow \mathbb{G}_{cold}$           |
| • $\phi \rightarrow \Delta\phi^{\text{sheath}}$ |

[Isoardi JCP10; Caschera Varenna 18]

$$\bullet \frac{d\bar{F}_s}{dt} = \mathcal{C} + \mathcal{S} + \mathcal{D} - \nu \mathcal{M}^{\text{mat}}(r, \theta) [\bar{F}_s - \mathbb{G}_{\text{cold}}]$$

$$\bullet \Delta n_e = \rho + \frac{1}{n_{e0}} \sum_s Z_s \nabla_{\perp} \cdot \left( \frac{n_{s0}}{B \Omega_s} \nabla_{\perp} \phi \right)$$

with  $\frac{T_e}{e} \Delta n_e = \phi - \lambda \left[ 1 - \mathcal{M}^{\text{SOL}}(r) \right] \langle \phi \rangle_{\mathcal{J}\mathcal{S}}$

$$- \lambda \frac{e}{T_e} \Delta \phi^{\text{sheath}} \left[ \mathcal{M}^{\text{SOL}}(r) - \mathcal{M}^{\text{mat}}(r, \theta) \right] (T_e - T_e^{b.c.})$$

$$- \left[ \mathcal{M}^{\text{mat}}(r, \theta) - \mathcal{M}^{\text{wall}}(r) \right] \phi^{\text{bias}}$$

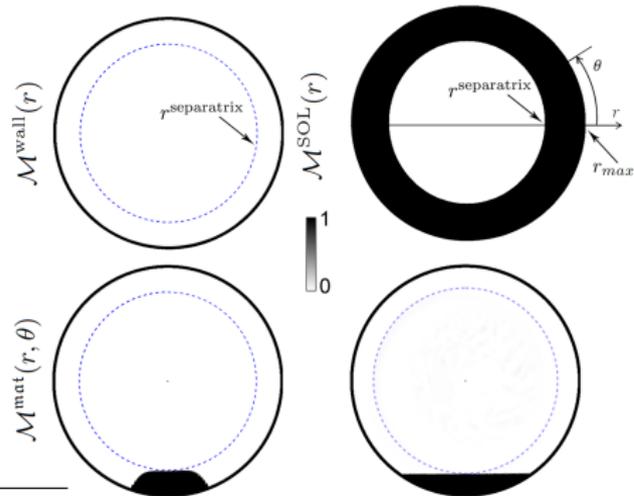

with  $\rho(\mathbf{x}, t) = \frac{1}{n_{e0}} \sum_s Z_s \int d^3v \mathcal{J} \cdot (\bar{F}_s - \bar{F}_{s,eq})$

- ▶ global domain:  $0 \leq r/a \leq 1.3$
- ▶ Tore Supra #45511
- ▶  $\rho_{*} \approx 1/300 \rightarrow$  in the "local limit"

- no transport of mass
- transport of energy & momentum

→ "baseline" instab. ITG+PVG; extension to TKEs  
[see P. Donnel, [this conference](#)]

Tokamak volume	Mask
All plasma	$1 - \mathcal{M}^{\text{mat}}(r, \theta)$
Closed field lines	$1 - \mathcal{M}^{\text{SOL}}(r)$
Scrape-Off Layer	$\mathcal{M}^{\text{SOL}}(r) - \mathcal{M}^{\text{mat}}(r, \theta)$
Material boundaries	$\mathcal{M}^{\text{mat}}(r, \theta)$
Limiter only	$\mathcal{M}^{\text{mat}}(r, \theta) - \mathcal{M}^{\text{wall}}(r)$
Wall only	$\mathcal{M}^{\text{wall}}(r)$

$$\bullet \frac{d\bar{F}_s}{dt} = \mathcal{C} + \mathcal{S} + \mathcal{D} - \nu \mathcal{M}^{\text{mat}}(r, \theta) [\bar{F}_s - \mathbb{G}_{\text{cold}}]$$

$$\bullet \Delta n_e = \rho + \frac{1}{n_{e0}} \sum_s Z_s \nabla_{\perp} \cdot \left( \frac{n_{s0}}{B\Omega_s} \nabla_{\perp} \phi \right)$$

with  $\frac{T_e}{e} \Delta n_e = \phi - \lambda \left[ 1 - \mathcal{M}^{\text{SOI}}(r) \right] \langle \phi \rangle_{\mathcal{J}_S}$

$$- \lambda \frac{e}{T_e} \Delta \phi^{\text{sheath}} \left[ \mathcal{M}^{\text{SOI}}(r) - \mathcal{M}^{\text{mat}}(r, \theta) \right] (T_e - T_e^{\text{b.c.}})$$

$$- \left[ \mathcal{M}^{\text{mat}}(r, \theta) - \mathcal{M}^{\text{wall}}(r) \right] \phi^{\text{bias}}$$

with  $\rho(\mathbf{x}, t) = \frac{1}{n_{e0}} \sum_s Z_s \int d^3v \mathcal{J} \cdot (\bar{F}_s - \bar{F}_{s,eq})$

- global domain:  $0 \leq r/a \leq 1.3$
- Tore Supra #45511
- $\rho_{\star} \approx 1/300 \rightarrow$  in the "local limit"

- no transport of mass
- transport of energy & momentum

→ "baseline" instab. ITG+PVG; extension to TKEs  
[see P. Donnel, [this conference](#)]

## Systematic comparison TS#45511

#1 Flux-Driven & limiter

#2 Flux-Driven & poloidally symm.

$$\mathcal{M}^{\text{mat}}, \mathcal{M}^{\text{SOI}}, \mathcal{M}^{\text{wall}} \rightarrow 0$$

$$\forall t, r/a \geq 1 \quad \bar{F}_s \rightarrow \text{cst} \equiv F_{\#1}$$

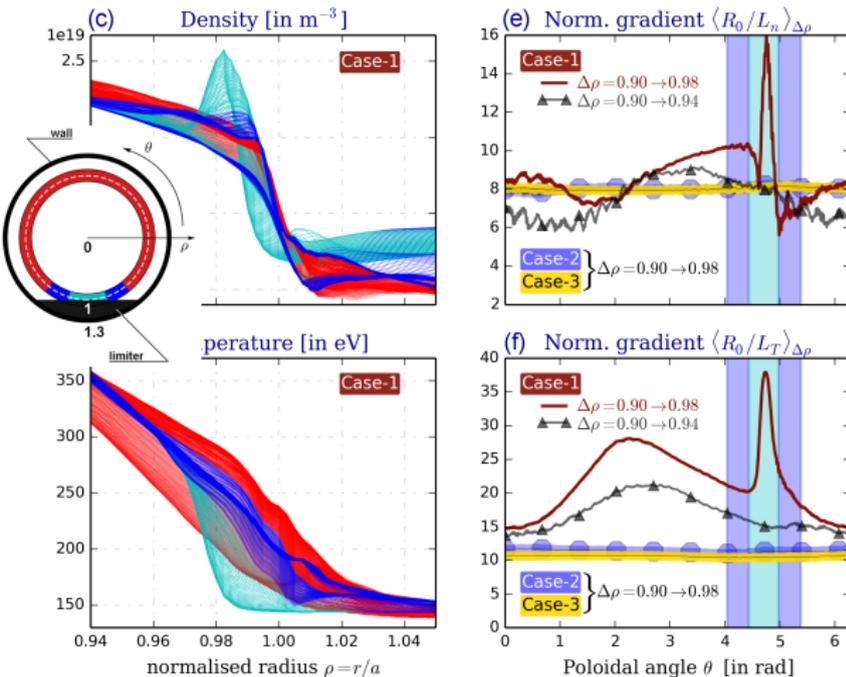

#3 Gradient-Driven & poloidally symm.

$$\mathcal{M}^{\text{mat}}, \mathcal{M}^{\text{SOI}}, \mathcal{M}^{\text{wall}} \rightarrow 0$$

$$\mathcal{S} \rightarrow 0$$

$$\forall r, t \quad \bar{F}_s \rightarrow \text{cst} \equiv F_{\#2}$$

linear analysis of GYSELA  
profiles with local GKW  
[Peeters CPC 09]

### w/o Limiter

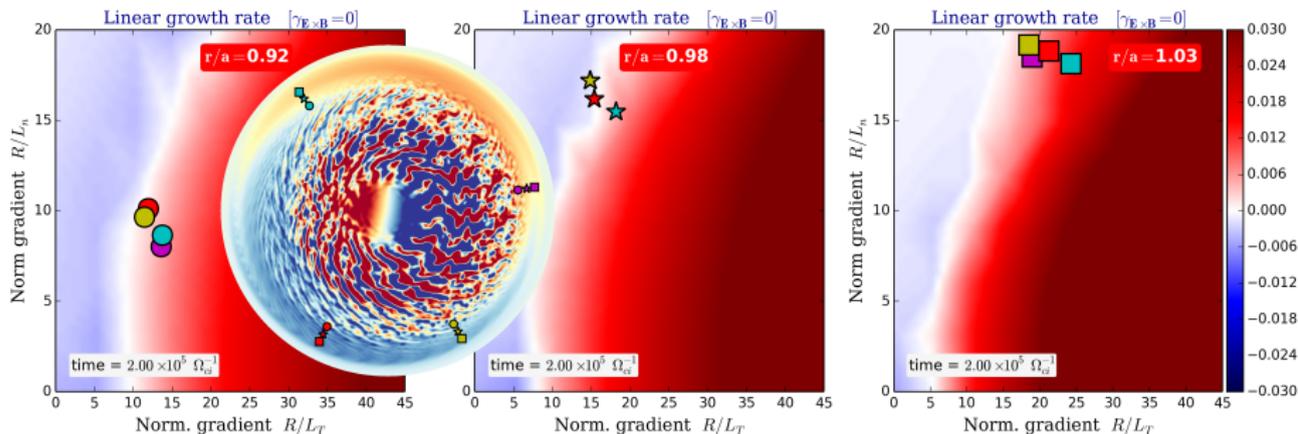

$\rho \leq .92$ : ITG/TEM unstable  
 $\rho \geq .92$ : outer edge stable

### with Limiter

- narrow  $(r, \theta)$  region DW/interchange unstable
- rest of edge is stable

► interesting situation: turbulence organisation in edge?

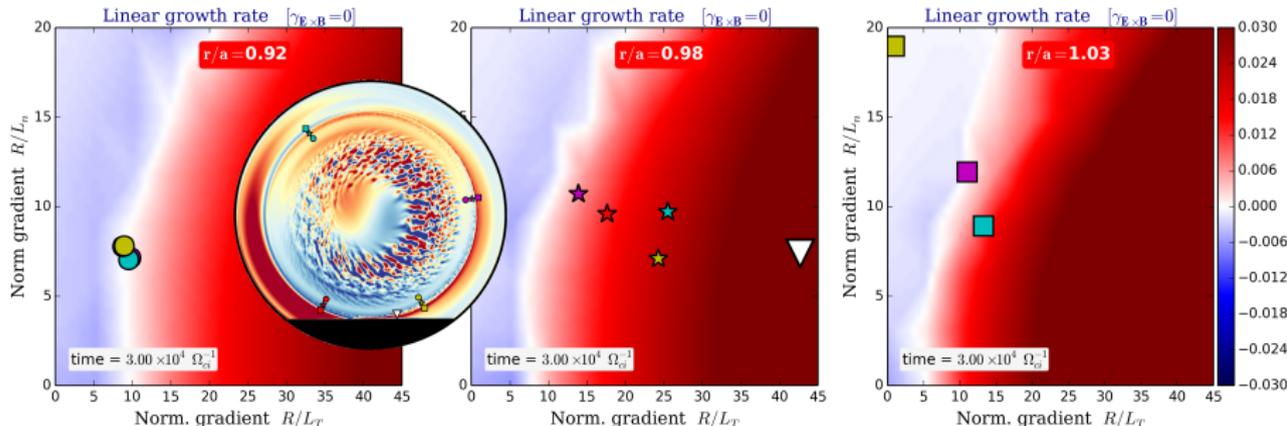

No Limiter  $\equiv$  polo. symmetric cases

major caveats:  $\mathbf{E} \times \mathbf{B} = 0$  & poloidally (parallel) homogeneity

long story short: ITG & TEM unstable  $r/a \leq 0.92$  ; outer edge stable  $r/a \geq 0.92$

**WITH Limiter**  $\equiv$  (large) localised free energy sources

when edge instab. starts: *profiles ~same @LFS midplane w/ or w/o limiter*

- narrow  $(r, \theta)$  region DW/interchange unstable ; PVG marginally unstable
- rest of edge is stable [marginally-unstable @steady-state]

➡ interesting situation: turbulence organisation in edge? investigate

$\delta n/n$

- reasonable trend with limiter;
- shortfall without;
- spreading ["contamination"] key

[Mattor; Garbet; Hahn; . . . ; Singh]

## Proxy for spatial turb. spreading:

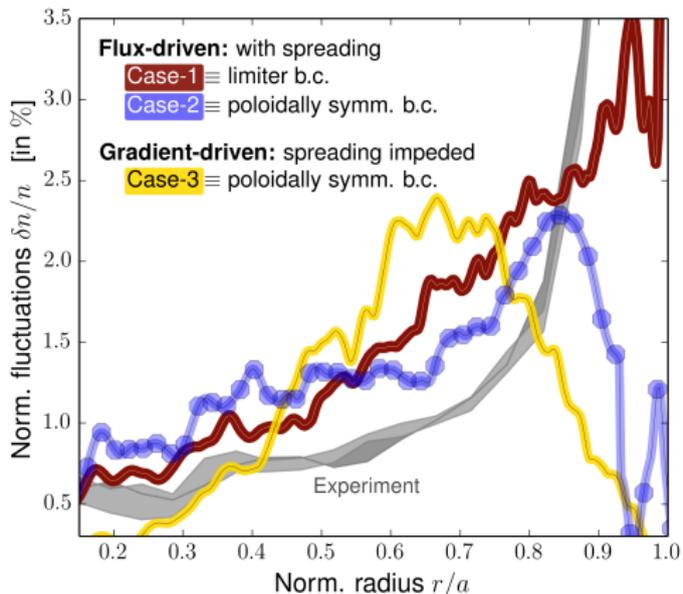

$$\left( \frac{\partial}{\partial t} + \bar{\mathbf{v}}_{E,\theta} \frac{\partial}{\partial \theta} \right) (nl) + \nabla \cdot \Gamma_I = \mathcal{P} - \mathcal{D}$$

$$\Gamma_I(r, \theta, t) \equiv \left\langle \int d^3v (\mathbf{v}_{ExB} \cdot \nabla r) \frac{\tilde{f}^2}{F_M} \right\rangle$$

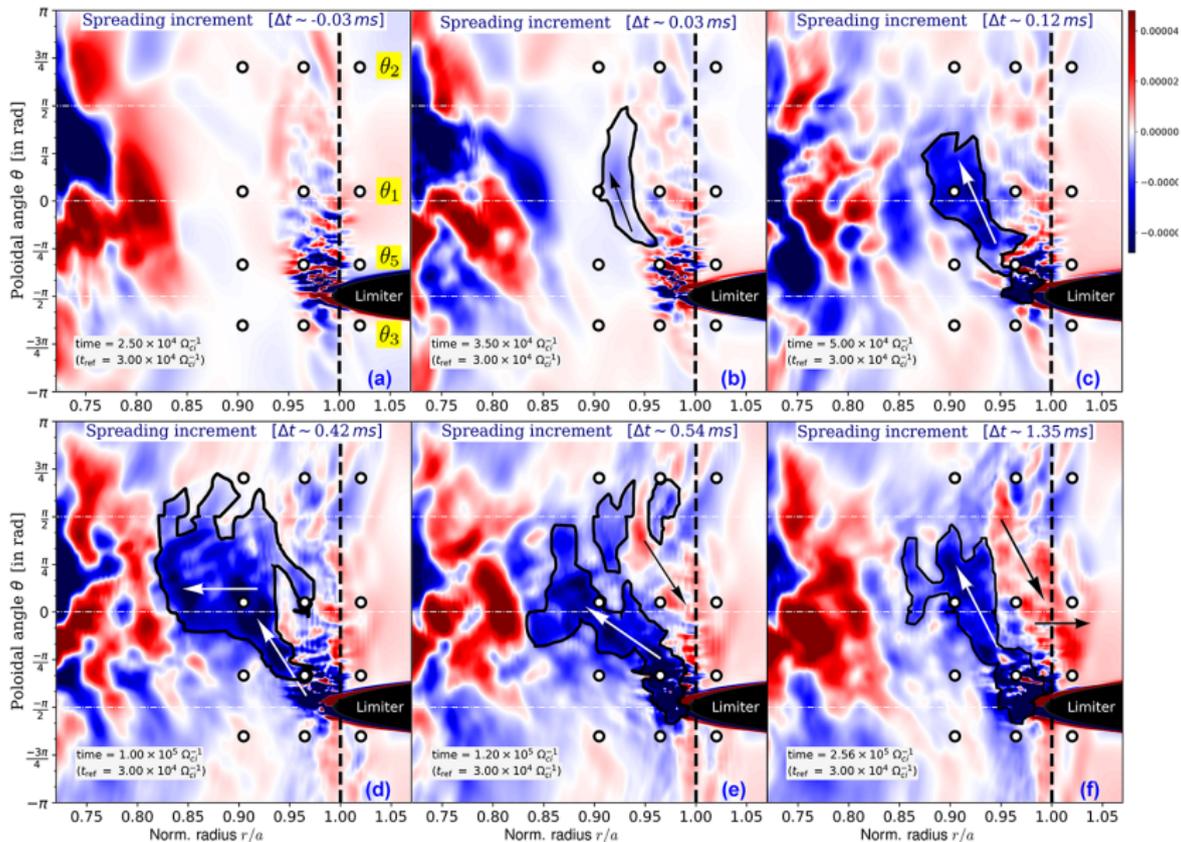

↳ investigate systematic spreading increments  $\Delta S \equiv \Gamma_I(r, \theta, t) - \Gamma_I(r, \theta, t_{ref})$

$\Delta S \geq 0 \rightarrow$  **radially-outward** fluxes of turbulence intensity

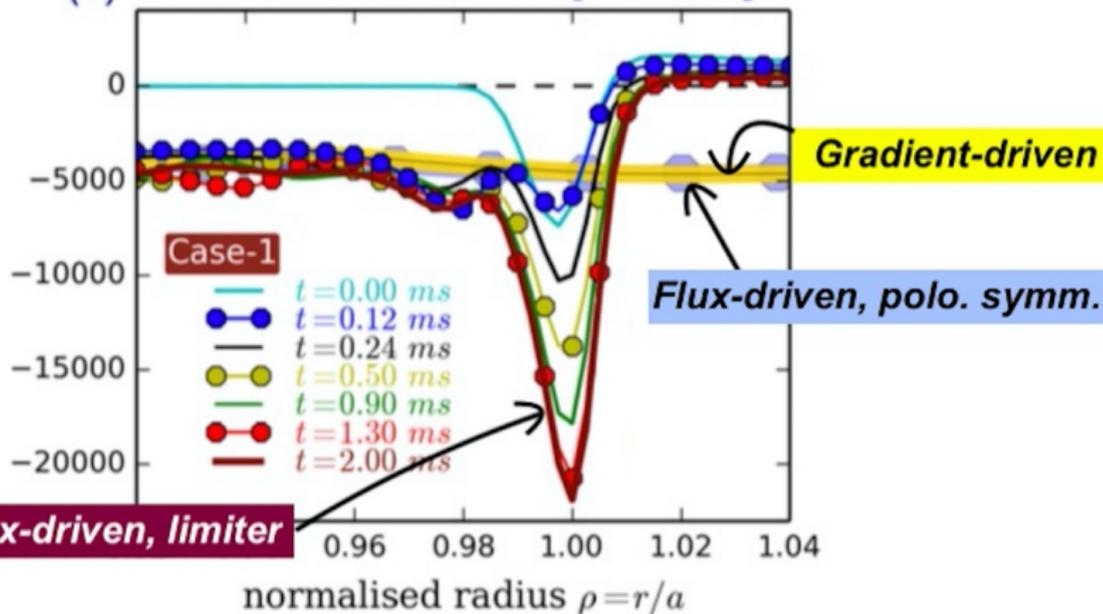

$\Delta S \leq 0 \rightarrow$  **inward** fluxes of turb. intensity

# Limiter-borne fluctuations contaminate → edge & core then LCFS ↔ core cyclic equilibration

(b) Radial electric field [in  $\text{Vm}^{-1}$ ]

- track vorticity production [GK eq. +  $\mathbf{E} \times \mathbf{B}$  velocity + gyroaverage [eg. Sarazin PPCF 2021]]

$$\partial_t \langle \Omega_r \rangle + \frac{1}{r} \partial_r r \left[ \langle v_{Er} \Omega_r \rangle + \langle v_{*r} \Omega_r \rangle - \left\langle v_{*\theta} \frac{1}{r} \partial_\theta E_r \right\rangle \right] = r.h.s$$

$$r.h.s \approx -\partial_t \langle \Omega_\theta \rangle - \frac{\partial_\theta}{r} \langle (v_{E\theta} + v_{*\theta}) \Omega_\theta \rangle - \partial_r \frac{\partial_\theta}{2r} \langle v_{E\theta}^2 \rangle + \frac{\partial_\theta}{2r^3} \partial_r \langle r^2 v_{Er}^2 \rangle - \frac{\partial_\theta}{r} \left\langle v_{*r} \frac{1}{r} \partial_\theta v_{E\theta} \right\rangle$$

$$\Omega_r \approx -\partial_r E_r \quad \& \quad \Omega_\theta = \partial_\theta^2 \phi / r^2$$

$$v_{Er} = -\partial_\theta \phi / r \quad \& \quad v_{E\theta} = \partial_r \phi = -E_r$$

$$v_{*r} = -\partial_\theta p_\perp / r \quad \& \quad v_{*\theta} = \partial_r p_\perp$$

- track vorticity production [GK eq. +  $\mathbf{E} \times$

$$\partial_t \langle \Omega_r \rangle + \frac{1}{r} \partial_r r \left[ \langle v_{Er} \Omega_r \rangle + \langle v_{*r} \Omega_r \rangle - \langle v_{*r} \Omega_r \rangle \right]$$

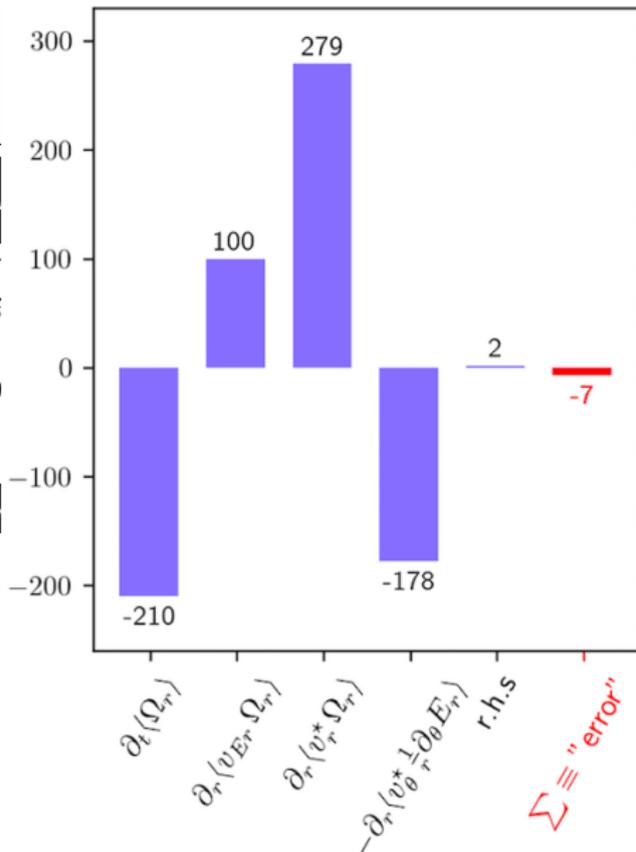

$$r.h.s \approx -\partial_t \langle \Omega_\theta \rangle - \frac{\partial_\theta}{r} \langle (v_{E\theta} + v_{*\theta}) \Omega_\theta \rangle - \hat{c}$$

$$\Omega_r \approx -\partial_r E_r \quad \& \quad \Omega_\theta = \partial_\theta^2 \phi / l$$

$$v_{Er} = -\partial_\theta \phi / r \quad \& \quad v_{E\theta} = \partial_r \phi$$

$$v_{*r} = -\partial_\theta p_\perp / r \quad \& \quad v_{*\theta} = \partial_r p_\perp$$

- accurate vorticity balance

- track vorticity production [GK eq. +  $\mathbf{E} \times \mathbf{B}$  velocity + gyroaverage [eg. Sarazin PPCF 2021]]

$$\partial_t \langle \Omega_r \rangle + \frac{1}{r} \partial_r r \left[ \langle v_{Er} \Omega_r \rangle + \langle v_{\star r} \Omega_r \rangle - \left\langle v_{\star \theta} \frac{1}{r} \partial_\theta E_r \right\rangle \right] = r.h.s$$

$$r.h.s \approx -\partial_t \langle \Omega_\theta \rangle - \frac{\partial_\theta}{r} \langle (v_{E\theta} + v_{\star \theta}) \Omega_\theta \rangle - \partial_r \frac{\partial_\theta}{2r} \langle v_{E\theta}^2 \rangle + \frac{\partial_\theta}{2r^3} \partial_r \langle r^2 v_{Er}^2 \rangle - \frac{\partial_\theta}{r} \left\langle v_{\star r} \frac{1}{r} \partial_\theta v_{E\theta} \right\rangle$$

$$\Omega_r \approx -\partial_r E_r \quad \& \quad \Omega_\theta = \partial_\theta^2 \phi / r^2$$

$$v_{Er} = -\partial_\theta \phi / r \quad \& \quad v_{E\theta} = \partial_r \phi = -E_r$$

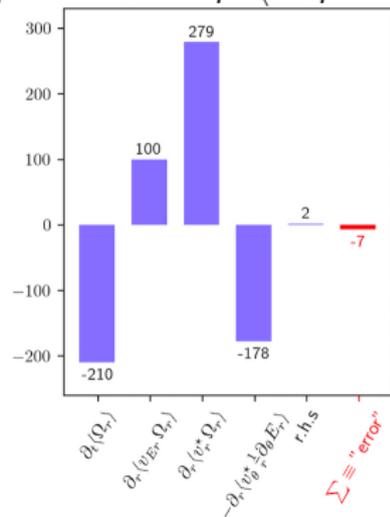

$$v_{\star r} = -\partial_\theta p_\perp / r \quad \& \quad v_{\star \theta} = \partial_r p_\perp$$

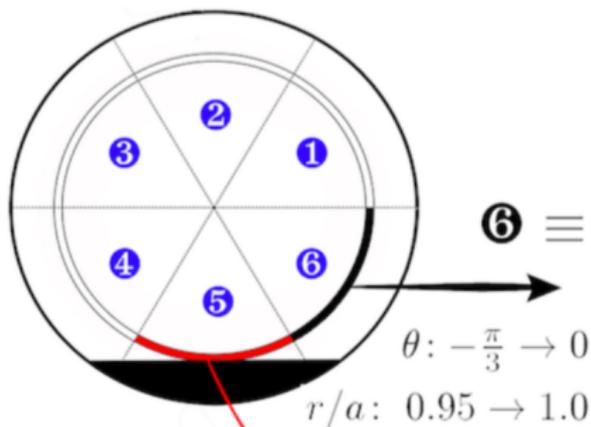

- accurate vorticity balance

- But...
  - no statement about dynamical relevance
  - assess causality in barrier build-up?

- “Transfer Entropy”**  $\equiv$  net directional flow of information

$\leftrightarrow$  **causality** [Schreiber PRL 00; ... VanMilligen NF 14; Nicolau PoP 18]

(b)

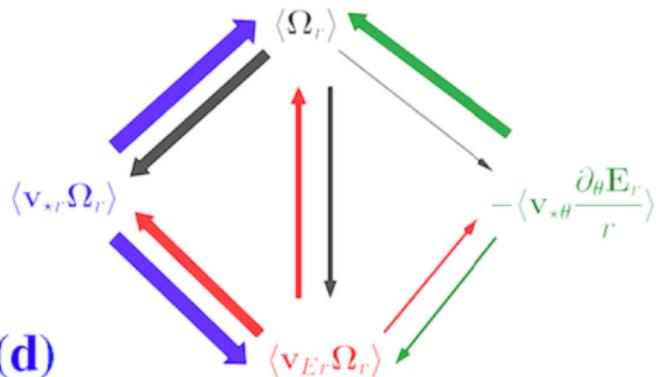

no fluctuations

**5**  $\equiv$

$\theta: -\frac{2\pi}{3} \rightarrow -\frac{\pi}{3}$

$r/a: 0.95 \rightarrow 1.0$

(d)

- ▶ penalised limiter → **simplified SOL** miss  $e^-$  || dynamics; convection & neutrals  
↳ free energy injection in narrow region → turb. redistribution key

- ▶ **interplay SOL, edge & core**

[Dif-Pradalier, Communications Physics 2022]

- spontaneous persistent **transport barrier**  $\equiv E_r$  build-up;
- **with limiter: no “shortfall”**  $\equiv$  clarifies spreading controversy
  - ① poloidal asymmetry (cold region...)
  - ② edge-to-core then
  - ③ cyclic edge→core & core→edge
- **w/o limiter:** edge stable & **strong “shortfall”** in NM’sL

- ▶ Turbulence **not only locally driven** by local gradients but ‘nonlocally’ controlled by **fluxes of turb. activity**, primarily (though not exclusively) coming **from the edge** & mediated thru **interplay with material bound.**

- ▶ transp. barrier build-up →  $\langle v_{Er} \Omega_r \rangle$ ,  $\langle v_{*r} \Omega_r \rangle$  &  $\langle v_{*\theta} \frac{\partial_\theta E_r}{r} \rangle$  **key to  $E_r$  growth**
