**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

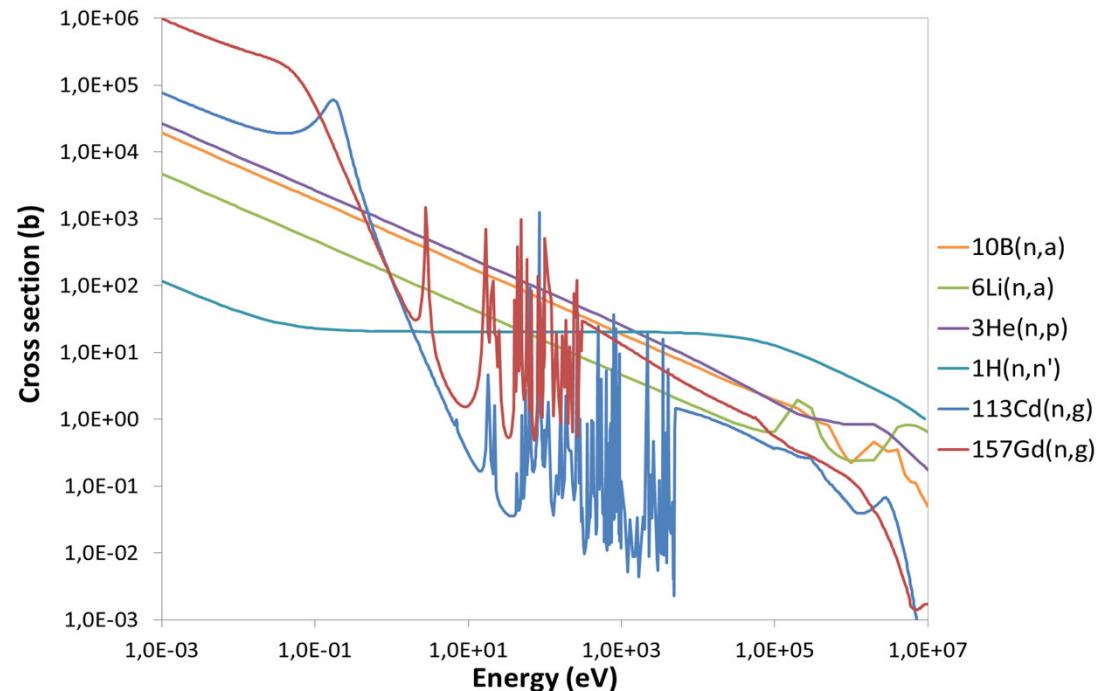

## NEUTRON DETECTION USING A GADOLINIUM COVERED CDZNTE DETECTOR

ISOE International Symposium Brussels, 1-3 June 2016  
COULON Romain, KONDRAOV'S Vladimir, DUMAZERT Jonathan, BOUDERGUI Karim

- **CONTEXT:**
  - The need: miniaturized neutron detector.
  - State of the art: Silicon technology implementing Boron, lithium, and PE convertors.
  - Limitation: Low neutron efficiency / high detection limits.
  
- **RESEARCH PATH:**
  - The use of Gadolinium convertor (higher cross section than  $^{10}\text{B}$ ,  $^6\text{Li}$  and  $^3\text{He}$ ).
  - The use of CdZnTe diode to detect the radiative signal from Gd captures.
  - The use of a reliable compensation techniques.

## THE CHALLENGE WITH GADOLINIUM

- ADVANTAGES
- The highest neutron cross-section (50000 barns)
- The availability and cost efficiency of the material
- The high energy released by the reaction (8 MeV)

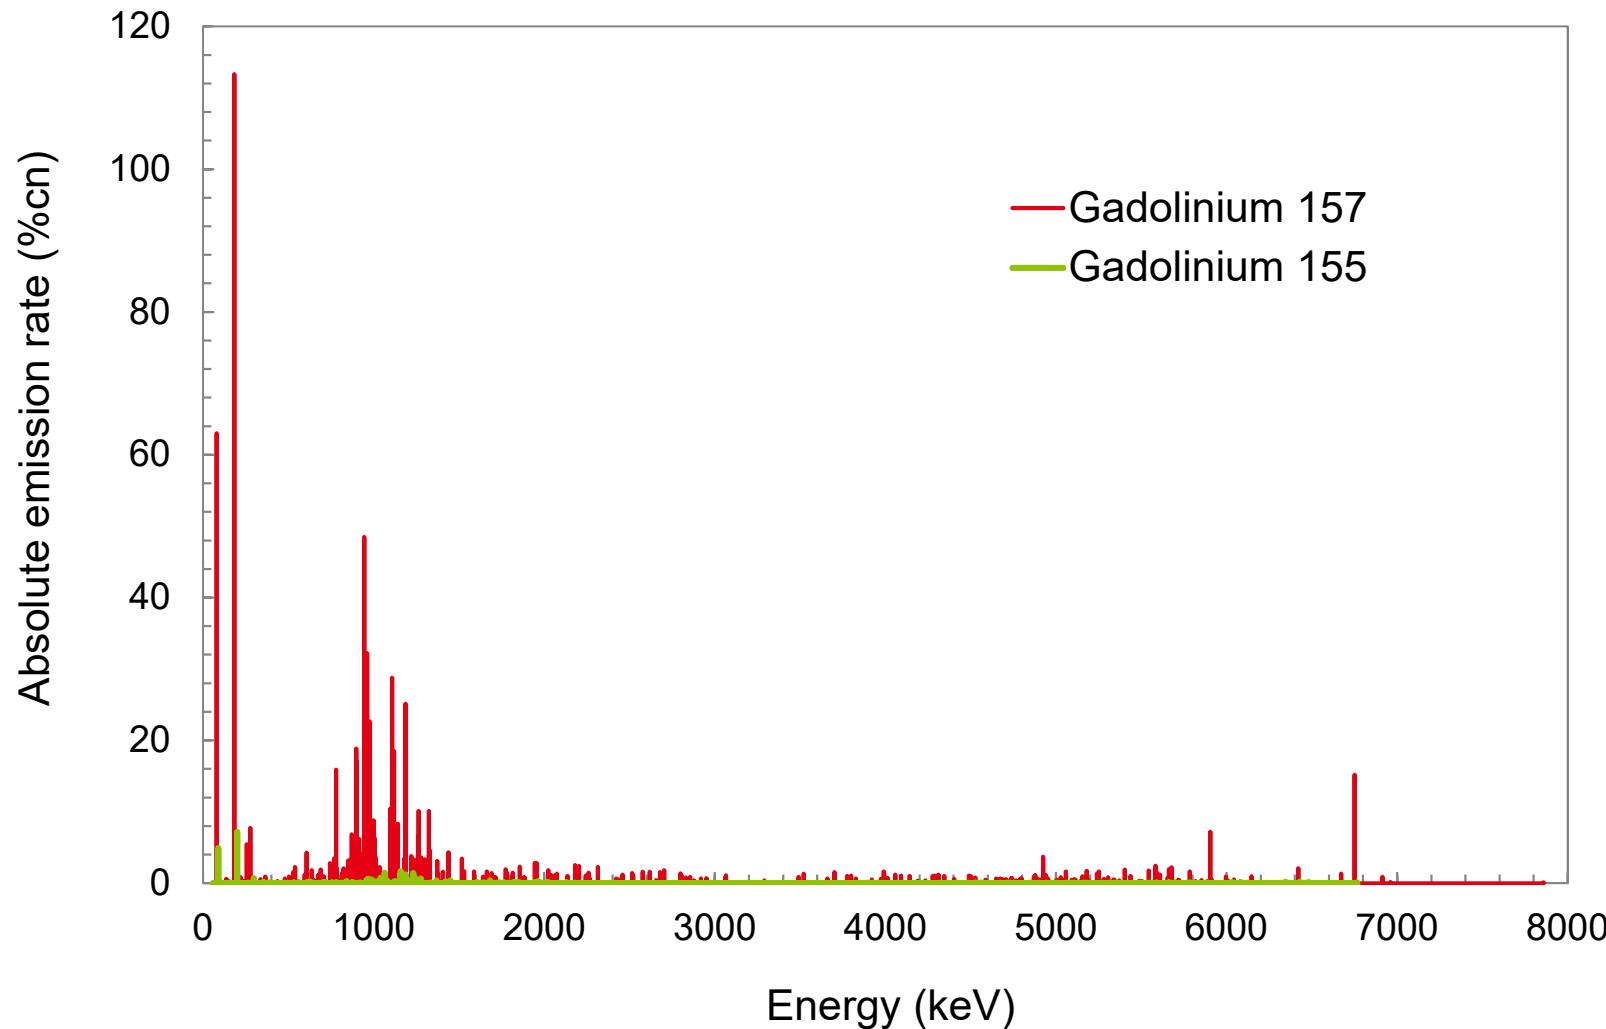

## THE CHALLENGE WITH GADOLINIUM

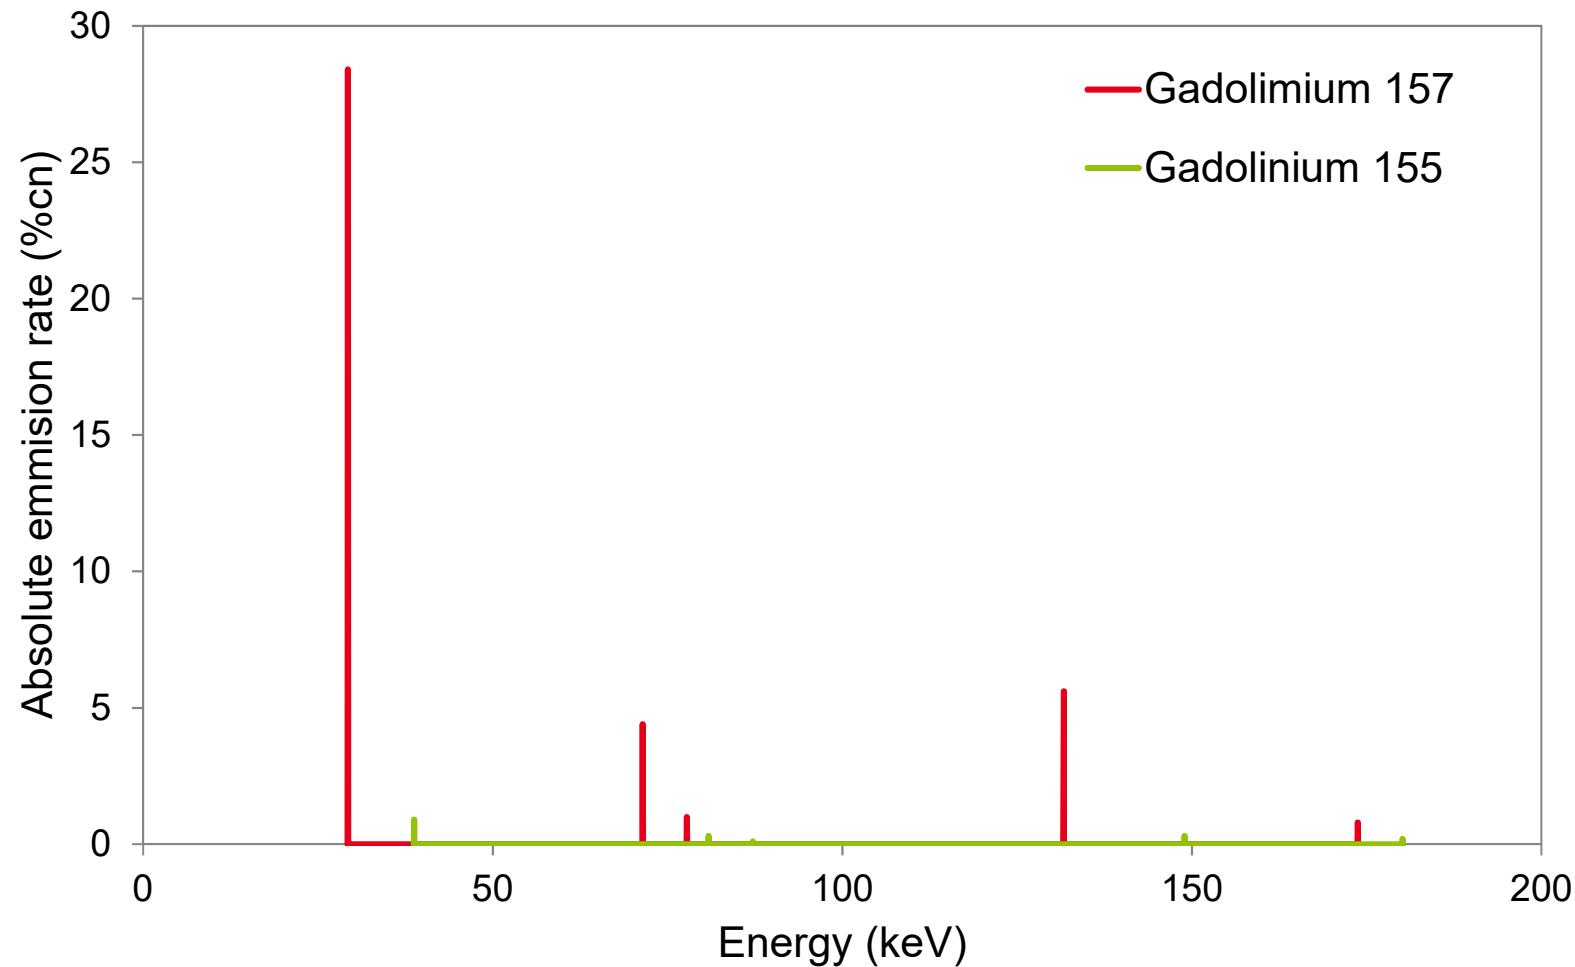

- **DRAW-BACKS**
- **The mainly radiative forms of the signature**
- **The escape of the signal of interest**
- **No discrimination with background gamma rays**

## THE SIGNATURE (PROMPT GAMMA RAYS)

## THE SIGNATURE (INTERNAL CONVERSION ELECTRONS)

## THE SIGNATURE

- **Low energy signature [0; 200] keV (electron IC &  $\gamma$  rays)**
  - Measurement based on compensation techniques
  - Small size detector
  - 242 %cn
- **Medium energy signature [0.2; 3] MeV ( $\gamma$  rays)**
  - Measurement based on compensation techniques
  - High size detector
  - 155 %cn
- **High energy signature [3; 8] MeV ( $\gamma$  rays)**
  - Measurement based on pulse height discrimination techniques (PHD)
  - High size detector
  - 52 %cn

### 2 strategies :

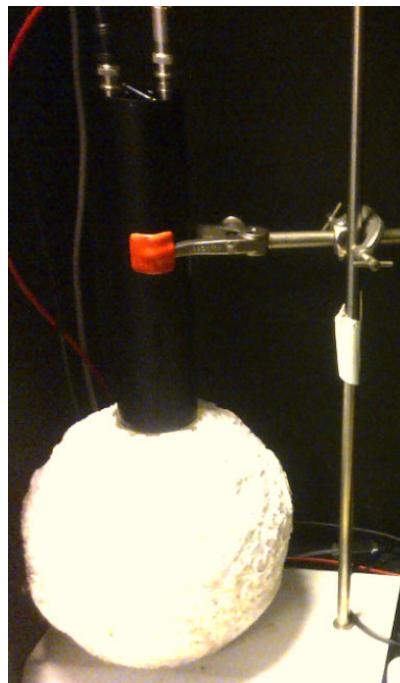

- **The low energy signature [0; 200] keV : compact sensor in compensation**
- **the high energy signature [3; 8] MeV : large sensor in PHD**

# THE STATE OF THE ART

J. Dumazert et al. Nuc. Instr. Meth. A Accepted (2016)

Patent, FR 15 52110

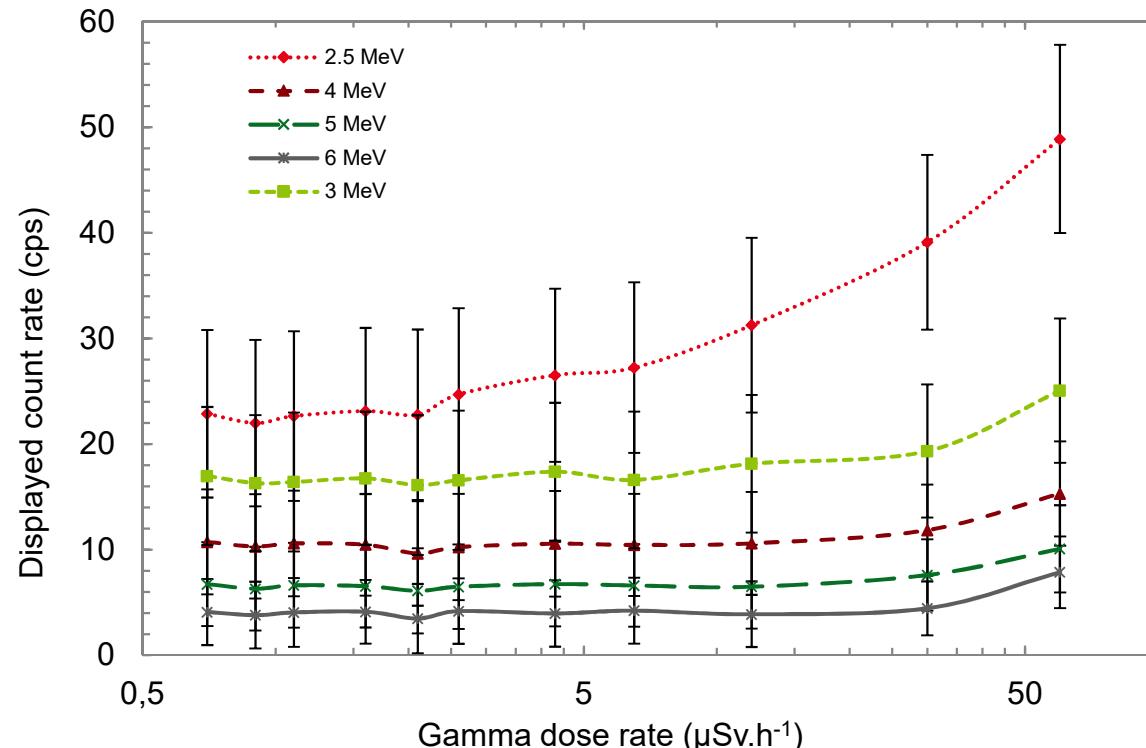

- The large sensor strategy (mobile or fixed systems)

**GADOPHERE®**

Spherical scintillator w/ Gd core  
Radius 12 cm.

Promising system: Sensitivity close to  ${}^3\text{He}$  Bonner sphere

*Stability curves of the systems*

## THE STATE OF THE ART

- The compact sensor strategy (portable systems)

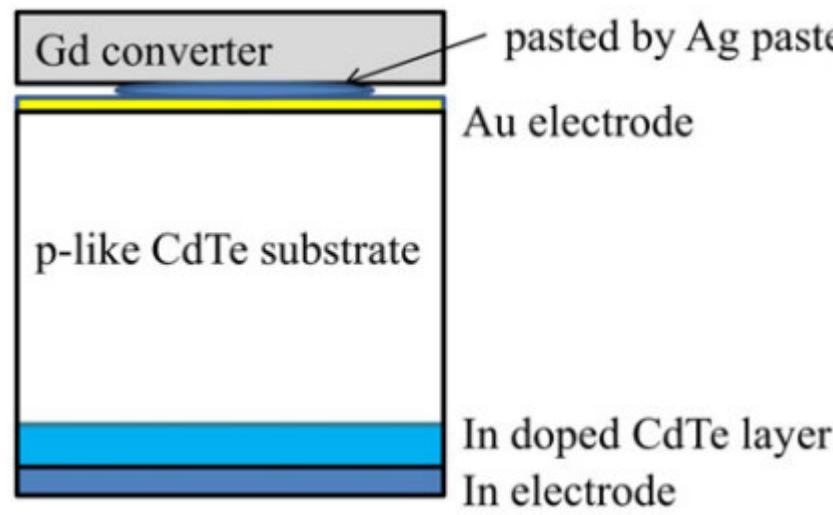

N.H. Lee, et. al, *IEEE Trans. Nucl. Sci.* 57 (2010) 3489-3492

P. Kandlakunta and L. Cao, *Rad. Prot. Dos.* 151 (2012) 586-590

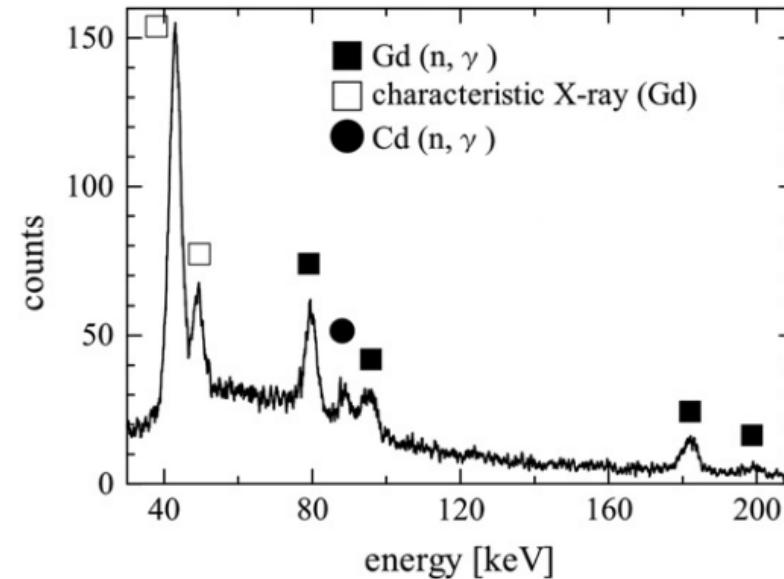

M. Fasasi, et. al, *Rad. Rad. Prot. Dos.* 23 (1988) 429-431

A. Miyake, et. al, *Nuc. Instr. Meth. A* 654 (2011) 390–393

Silicon detectors  
 CdTe detectors

Gd covered CdTe of Miyake

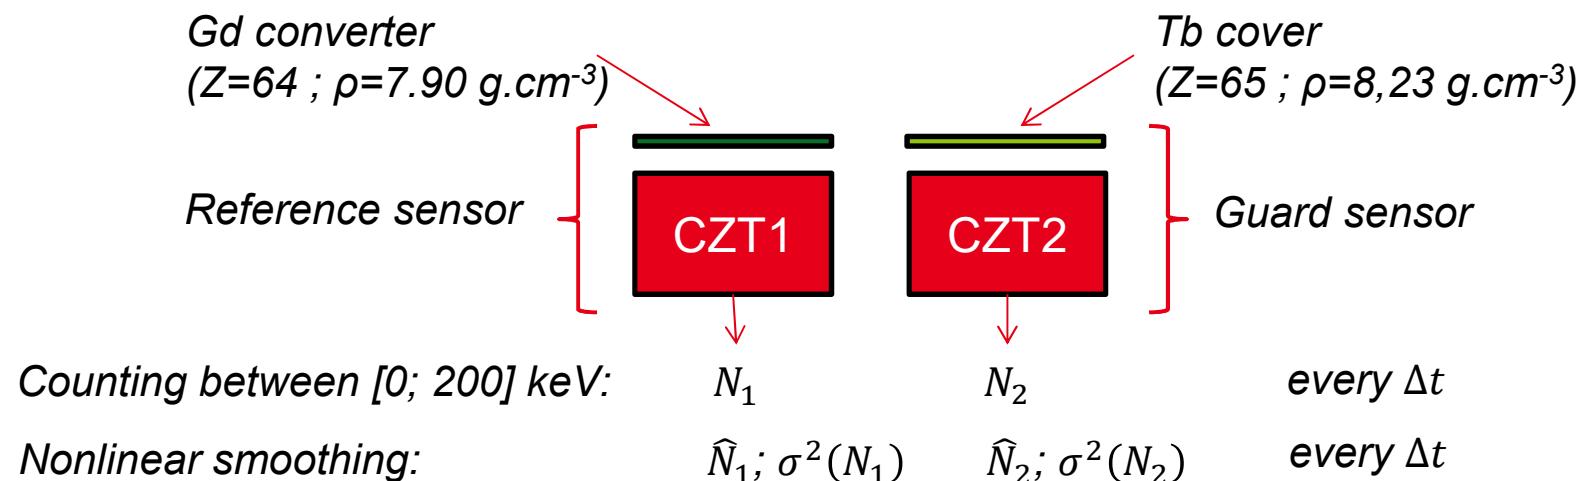

Spectrum measured under neutron flux by the Miyake detector

**CdTe & CdZnTe are well suited to measure the Gd signature between [0; 200] keV  
How compensate gamma rays background and provide neutron counting?**

# THE RUGGED COMPENSATION

- Design of a compact neutron counter

The optimal value for Gd converter is 25 µm. (cf. D.A. Abdushukurov, Nova Science Publishers, Inc. 2010)

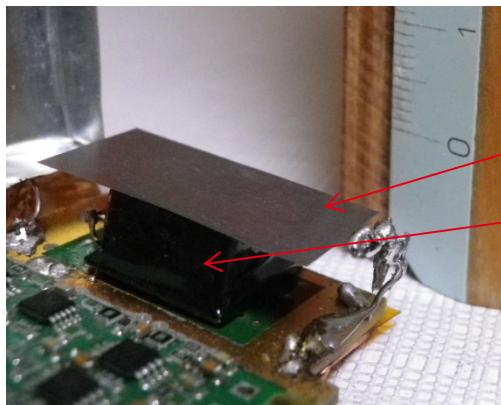

Cf. R. Coulon, et. al, Rad. Meas. 87 (2016) 13–23.

*Compensation algorithm (hypothesis test):*

If	$\hat{N}_1 - \hat{N}_2 > K\sqrt{\sigma^2(N_1) + \sigma^2(N_2)}$
Then	$\hat{S}_n = \hat{N}_1 - \hat{N}_2$
Else	$\hat{S}_n = 0$

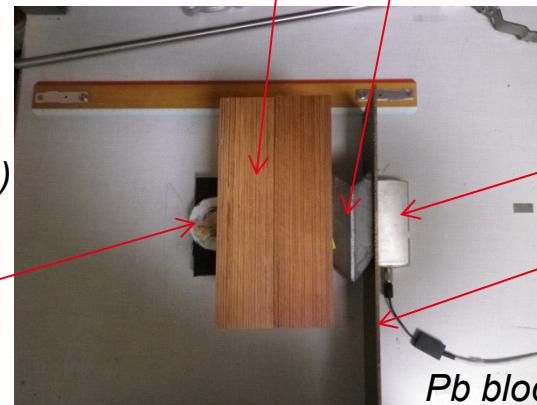

## EXPERIMENTAL TEST

- Experimental setup:

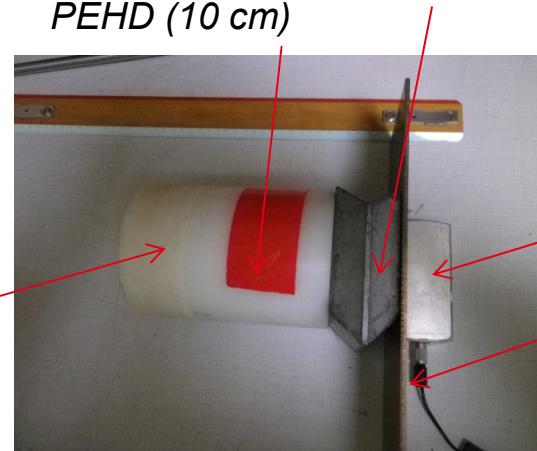

*Gd or Tb Foil*  
*CdZnTe (500 mm<sup>3</sup>)*  
*252Cf source*

*Borated wood (10 cm) Pb bloc (5 cm)*

*Detector*  
*Cu foil (2 mm)*

*Pb bloc (5 cm)*

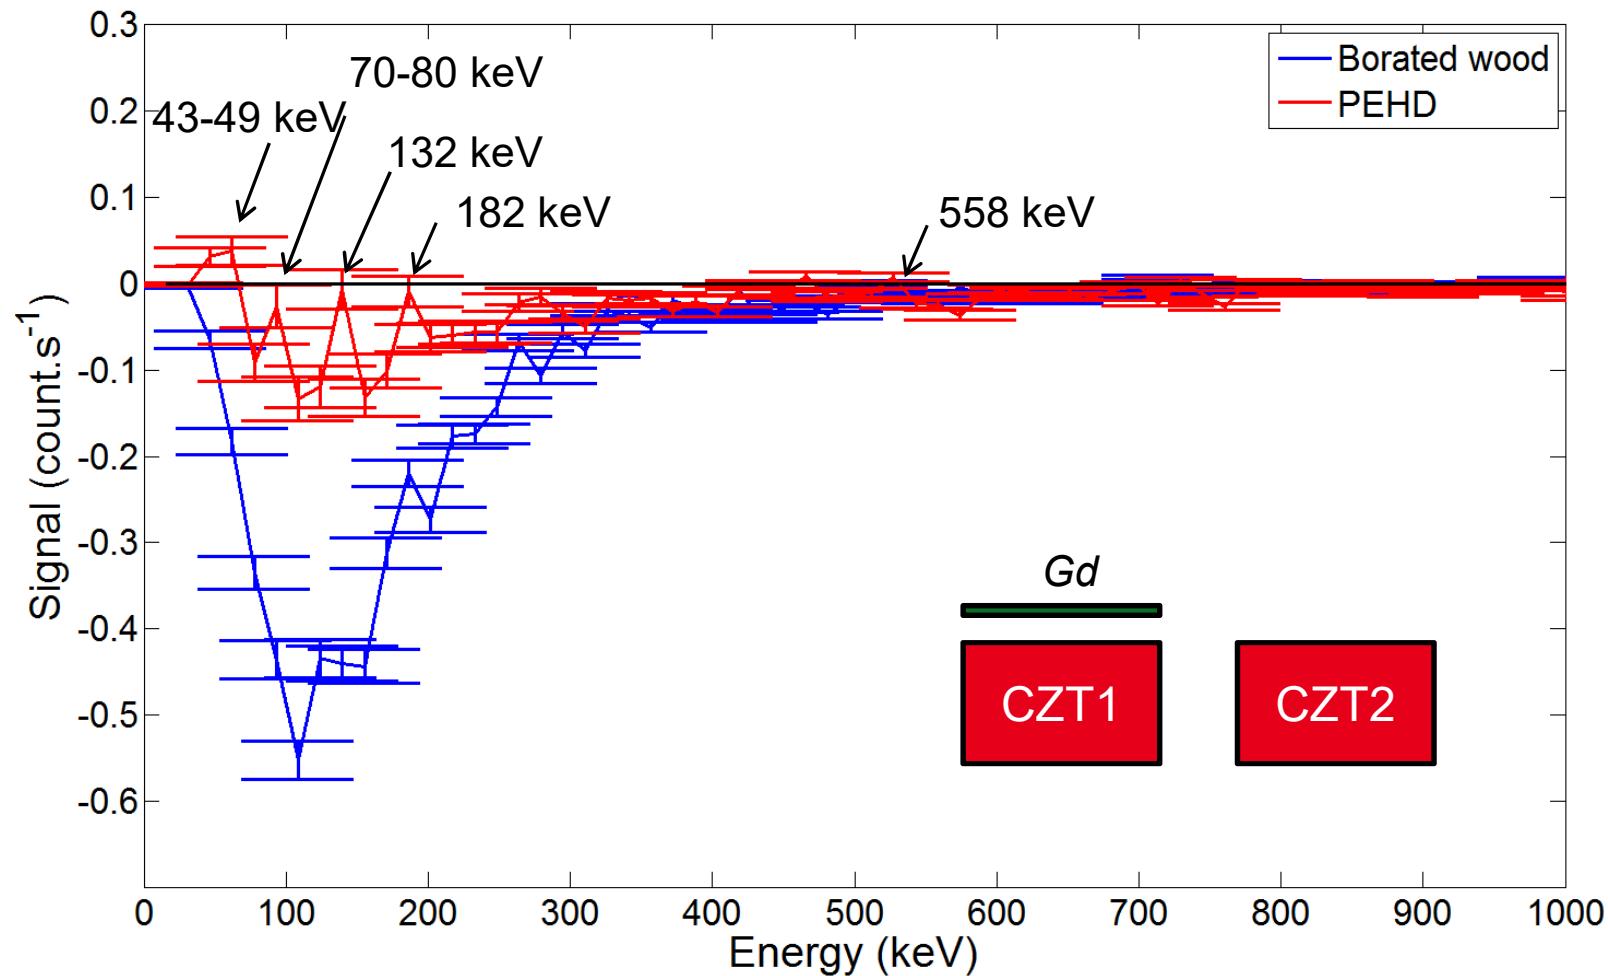

*Detector*  
*Cu foil (2 mm)*

*Cf. K. Boudergui, et. al, . ANIMMA 2011.*

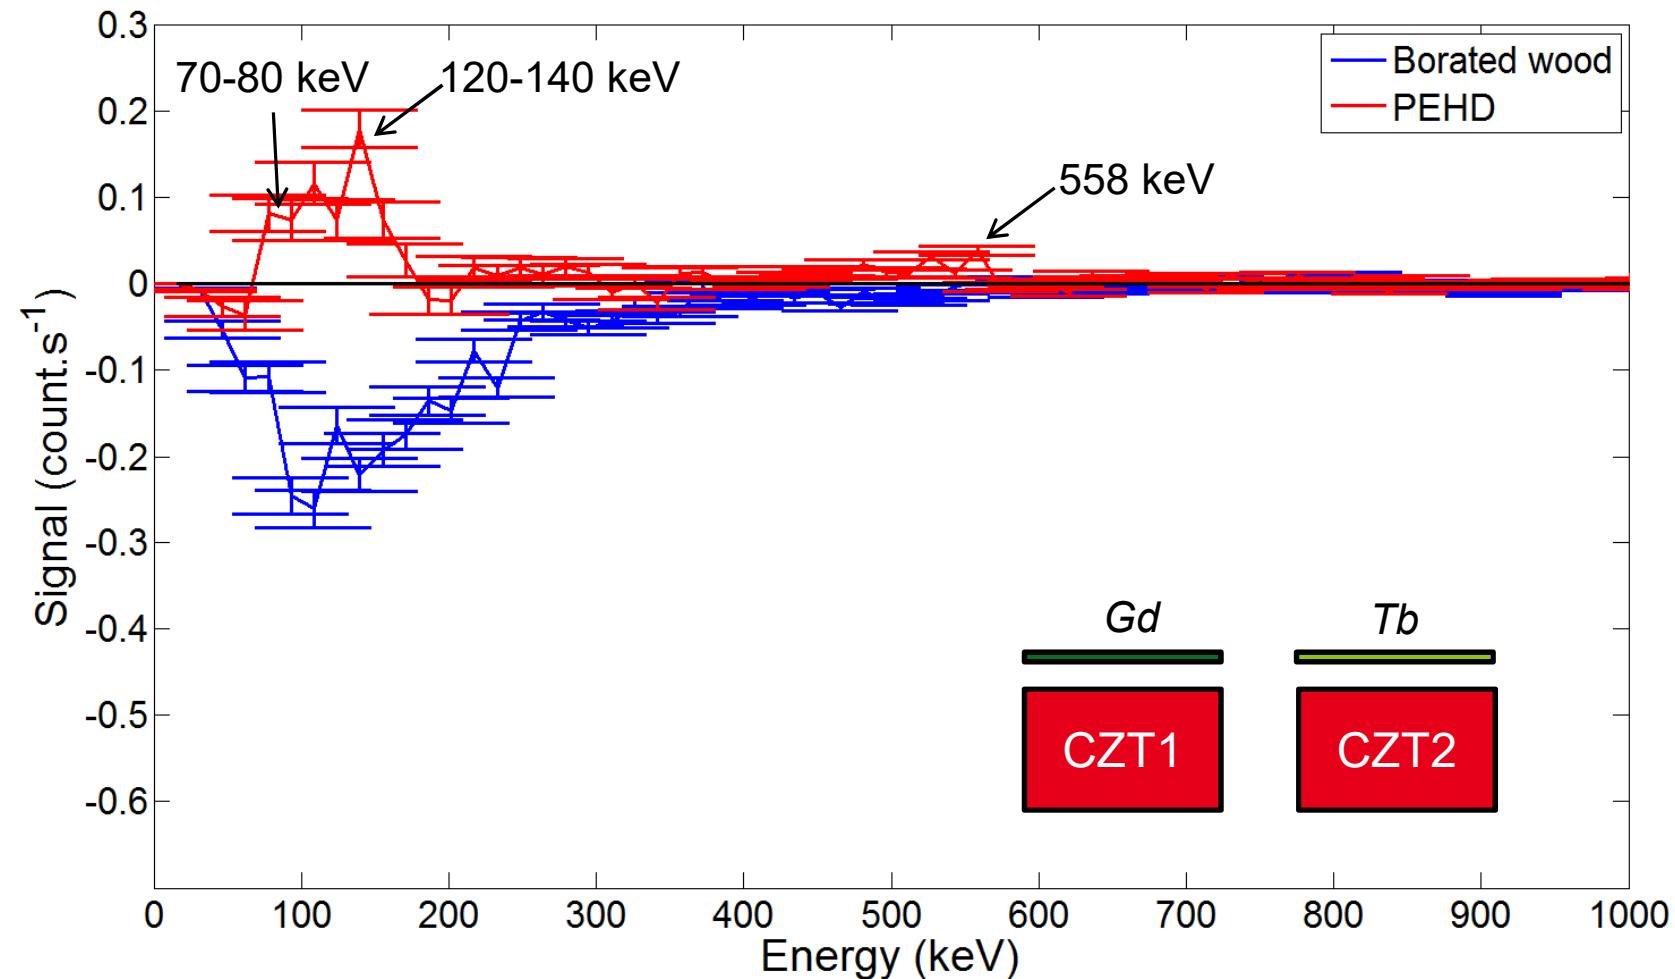

*Micro-sized Gamma Spectrometer from IMS.*

## RESULTS

## RESULTS

## RESULTS

	PEHD	Borated wood
Gd / void [60; 200] keV	-0.65 ± 0.34	-3.64 ± 0.30
Gd / Tb [60; 200] keV	<b>+0.55 ± 0.33</b>	-1.76 ± 0.29
Gd / void [500; 600] keV	-0.13 ± 0.07	-0.098 ± 0.052
Gd / Tb [500; 600] keV	<b>+0.102 ± 0.066</b>	-0.070 ± 0.051
Gd / void [60; 600] keV	-1.23 ± 0.39	-4.88 ± 0.34
Gd / Tb [60; 600] keV	<b>+0.79 ± 0.38</b>	-2.45 ± 0.33

Sensitivity ≈ 0.5 (c/s)/nv

## CONCLUSION

- According to the state of the art, the CdZnTe is convenient to measure low energy prompt gamma rays from  $^{157}\text{Gd}$ .
- A reliable compensation measurement could be implemented using a nonlinear smoothing and a hypothesis test.
- A significant gain in efficiency has been obtained by the implementation of a terbium covered guard CdZnTe.
- The concept has been proven and R&D works will be continued to design a portable neutron detector.
