HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Motivation. Experimental observation : turbulence increases with RMPs. Why? What kind of turbulence? Reason for density pump-out?

[AUG, N Leuthold, NF2023]:

Turbulence increases during ELM suppression by RMP N=2, density pump-out.

[HL2A, T F Sun, NF2021]:

Turbulence increases during ELM mitigation by RMP N=1, density pump-out.

turbulence spectrum (BES)

JOREK code.

[G Huysmans, NF 2007, PPCF 2009, M Hoelzl NF2021, <https://www.jorek.eu/>].

Fluid MHD model:

- Non-linear resistive MHD.
- Two fluid diamagnetic effects, rotation.
- Realistic geometry: SOL, divertor, walls, RMP coils.
- Bohm sheath boundary conditions.
- Flux-aligned grid, C^1 cubic Bezier finite elements in poloidal plane + toroidal Fourier harmonics.
- Parallelization: MPI/OpenMP, GPU.
- Fully implicit.
- Applications: ELMs, RMPs with plasma response, disruptions, pellets, runaways, etc

Kinetic particles for electrostatic ITG/TEMs:

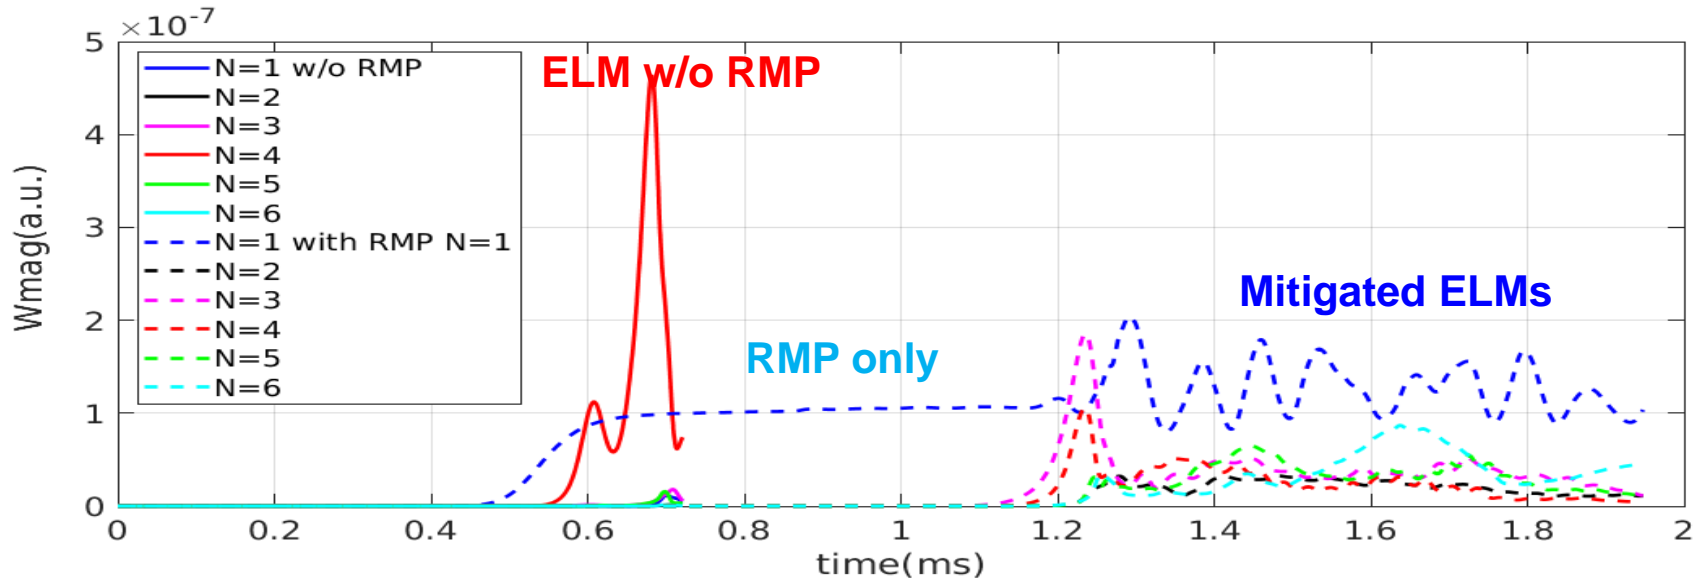

- Particles are initialized on the grid, plasma profiles and magnetic field from MHD.
- Non-linear full-f. Particles are advanced in time evolving electric field and static magnetic field (3D ergodic if RMPs!).
- Ions: // and ExB motion of gyro-centers in gyro-averaged electric field.
- Electrons: adiabatic or kinetic electrons.
- Projection and solution in weak form using the same basis functions as in fluid MHD.

ITG/TEM in COMPASS with RMPs

Fluid non-linear MHD modelling of ELMs mitigation by RMPs (N=1, 4.9kAt, odd) in H-mode (HL2A#36872)

Data from [HL2A, T F Sun, NF2021]

Density in ELM crash w/o RMP

Density in mitigated by RMP ELMs

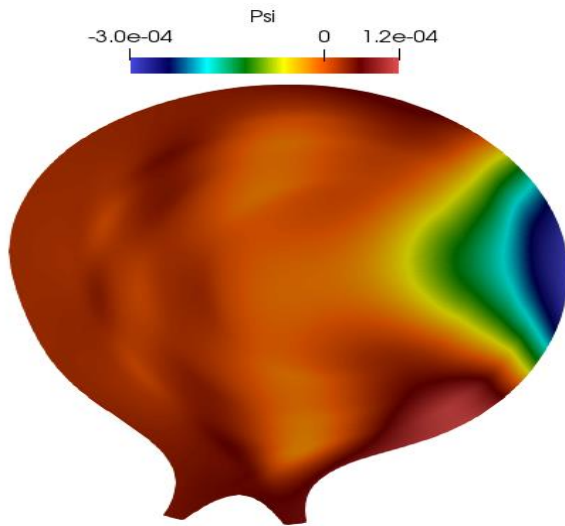

Equilibrium (3D with RMPs) and plasma profiles used for kinetic particles initialisation.

RMPs => 1) edge 3D ergodic field; 2) decreased pedestal gradients 3) decrease E_r "well". How they influence turbulence?

RMP coils in HL2A

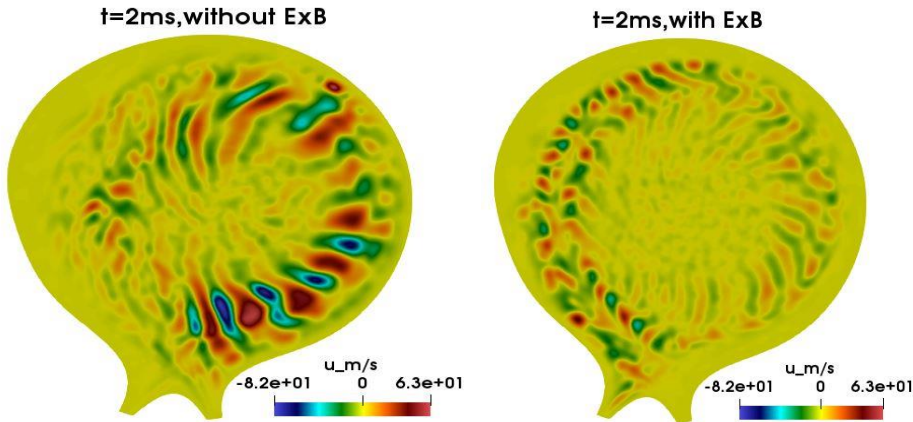

pol flux perturbation by RMP $N=1$, 4.9kAt, odd parity

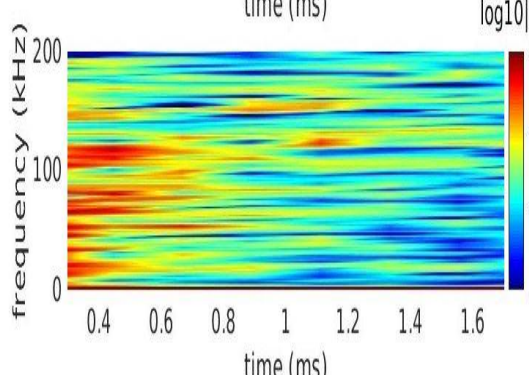

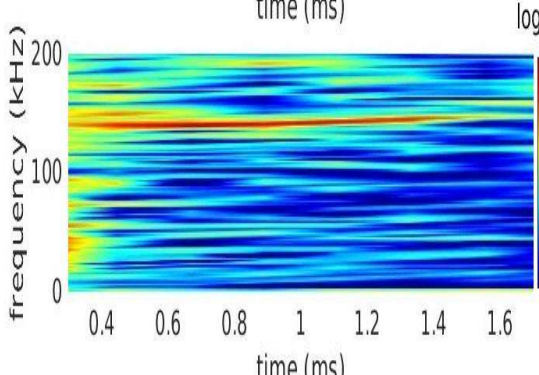

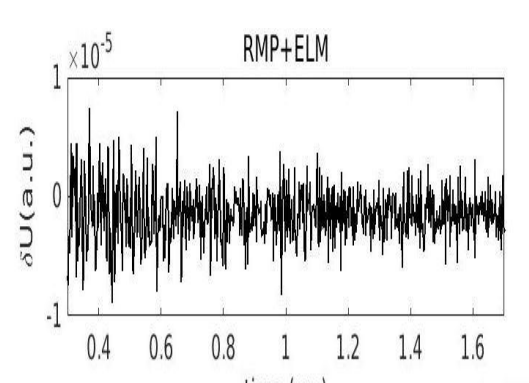

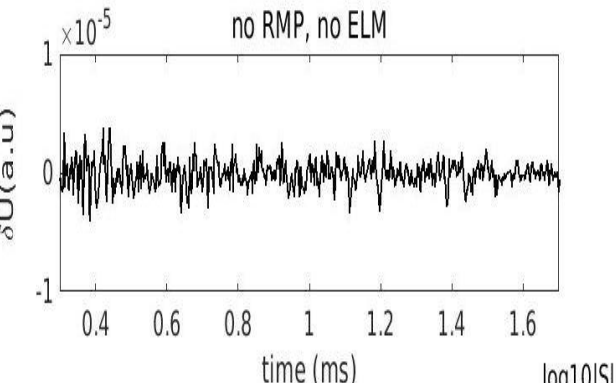

profiles

Non-linear gyro-kinetic modelling of ITGs with adiabatic electrons for H-mode (HL2A#36872). Stabilising effect of mean poloidal ExB flow in the pedestal.

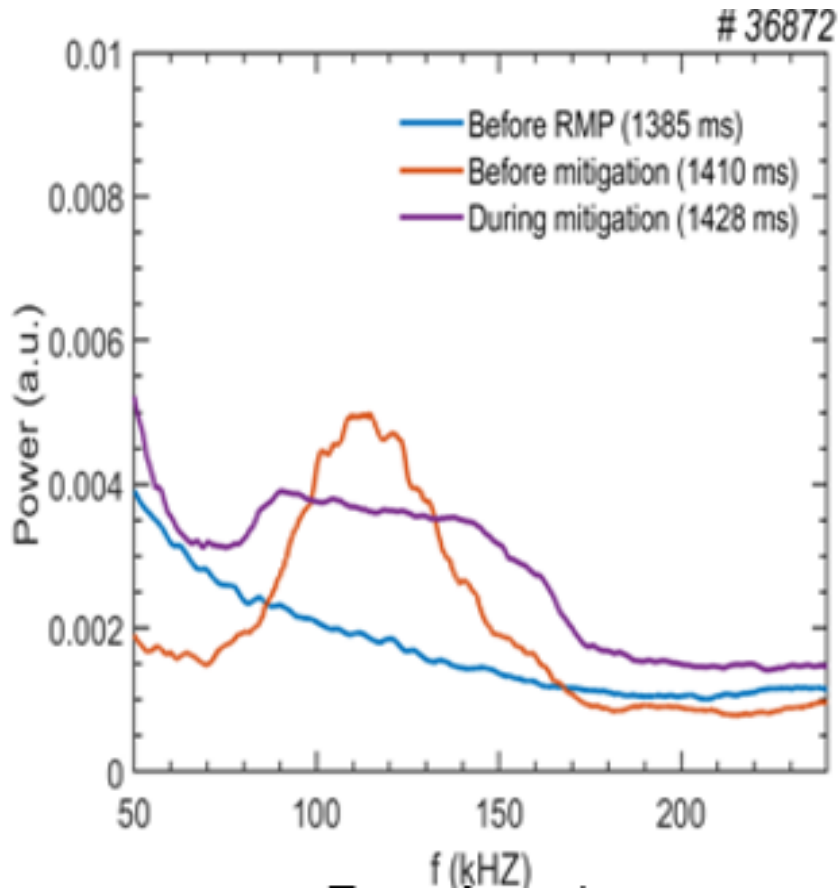

Potential fluctuations signal (upper rows) frequency spectra (low rows) in the pedestal w/o ELMs ,RMP; RMP only and mitigated ELMs in modelling of ITGs(N=1:1:20) with adiabatic electrons for HL2A #36872.

Frequency range and spectrum shape in modelling is similar to experimental

Experiment

[HL2A, T F Sun, NF2021]

JOREK

Modelling of ITG/TEM turbulence for COMPASS# 8078 L-mode

Data from [T Markovic NF2006]

JOREK as non-linear fluid MHD code => 3D fields and profiles with plasma response to RMP (N=2, 1.5kAt) are used for particles initialization.

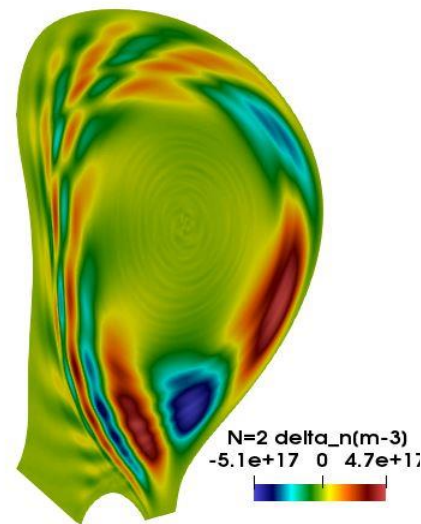

Density, temperature ($T_e=T_i$) mid-plane profiles

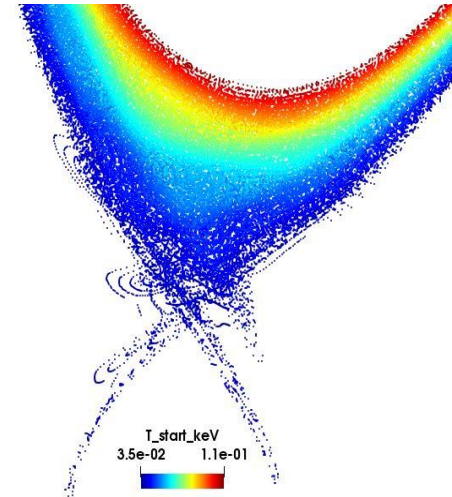

Magnetic flux perturbation with RMP

Density perturbation with RMP

Edge magnetic topology with RMP. Ergodic 3D field.

Increased turbulence with RMPs. Larger TEM/ITG with kinetic electrons compared to ITG with adiabatic electrons

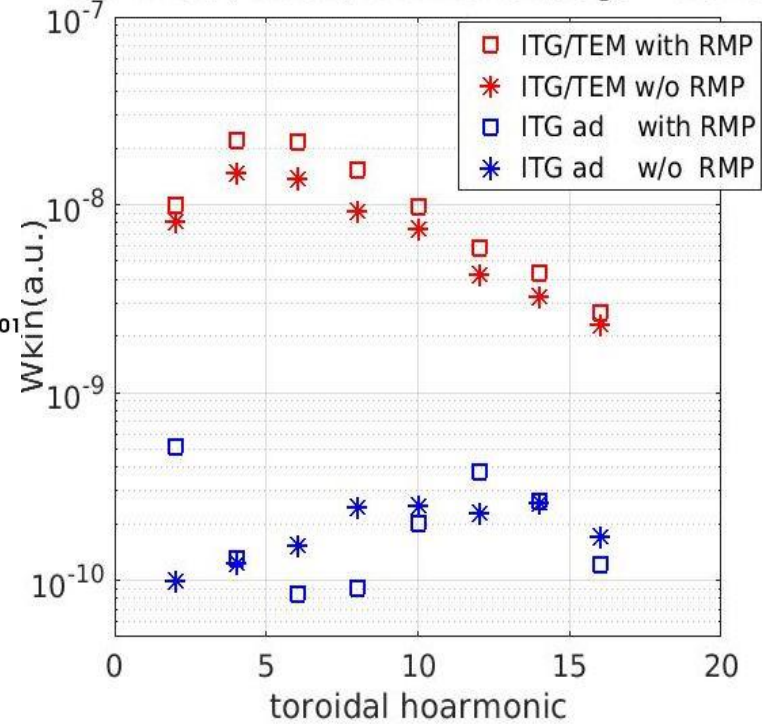

w/o RMP

time=1ms, TEM/ITG w/o RMP

COMPASS , ini 3D, Wkin tot average ~0.5ms

ITG,adiabatic

ITG+TEM, kinetic el, zonal

with RMP

time=1ms, TEM/ITG with RMP

ITG,adiabatic

ITG+TEM, kinetic el, zonal

With RMPs density fluctuations are increased (especially in the SOL)

$t=0.6\text{ms}$, w/o RMP

$t=0.6\text{ms}$, with RMP N=2, 1.5kAt

Toroidal asymmetry of turbulence with RMPs.

Seen in some experiments [AUG: N. Leuthold et al Nucl Fusion 63(2023)]

ITG, ad el

ITG/TEM, kinetic el

ITG/TEM (with kinetic electrons) and ITG (with adiabatic electrons) turbulence in plasmas with positive/negative triangularity.

DIII-D-like L-mode parameters [A Marinoni et al., Nucl Fus 61(2021)].

note that with the same profiles $q_{95_NT}=4.5$ $q_{95_PT}=3.6$ for PT)

**$R=1.74m$, $B_0=2T$, $q_{95}\sim 4.2$,
 elongation = 1.6, triangularity (up=low)=+ - 0.4,
 $T_e=T_i$. Limiter configuration in JOREK modelling for simplicity**

Initial profiles (n_e , $T_e=T_i$, ff') as a function of normalized poloidal flux are the same (L-mode) for negative and positive triangularity shapes

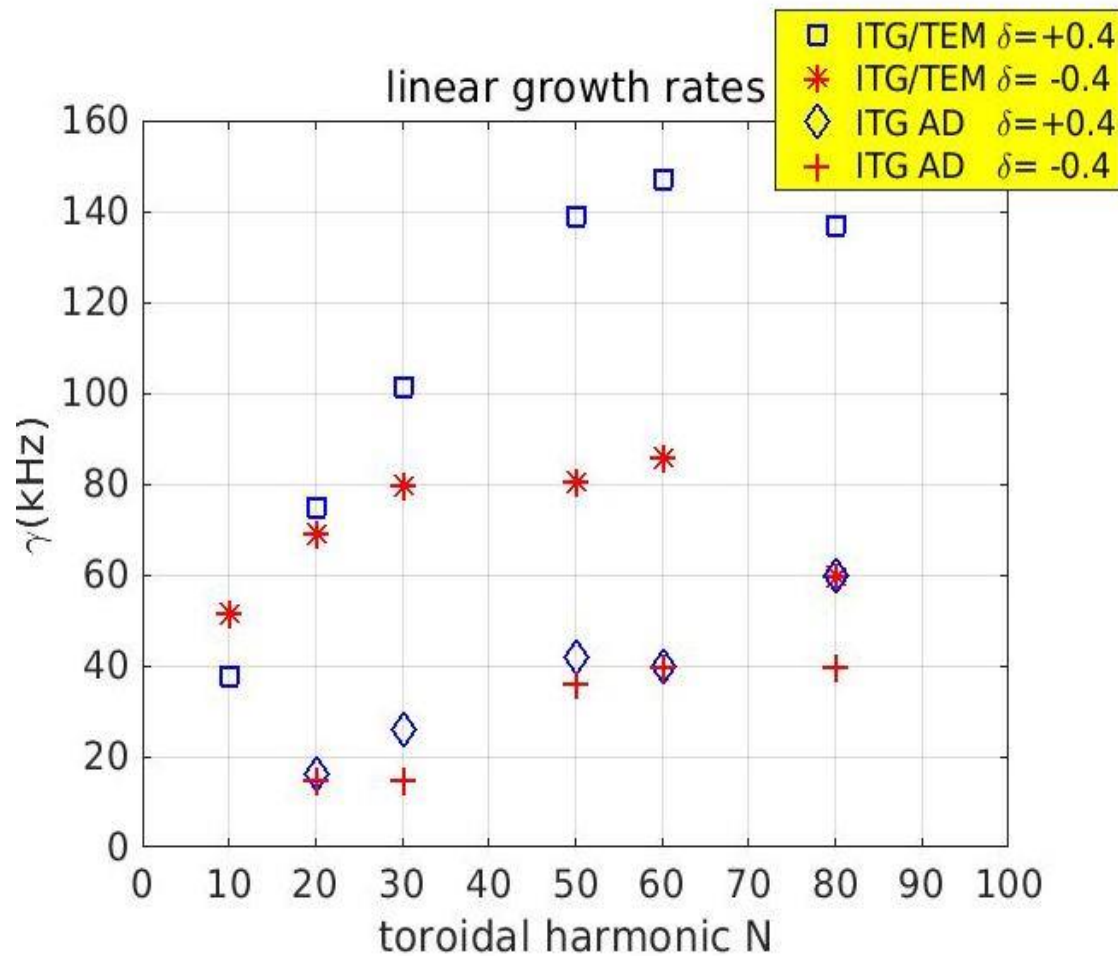

[A Marinoni et al., Nucl Fus 61(2021)]

Figure 3. Comparison between profiles of discharges 180520 (H-mode, ●) and 180533 (L-mode, ●). Electron density (a) and temperature (b) along with C^{6+} temperature (c) as a function of the normalized poloidal flux.

**Linear growth rates of ITG/TEM single modes with kinetic electrons at NT ($\delta=-0.4$) are smaller than in PT ($\delta=+0.4$) for $N>20$.
Smaller effect (if any) on ITGs with adiabatic electrons.**

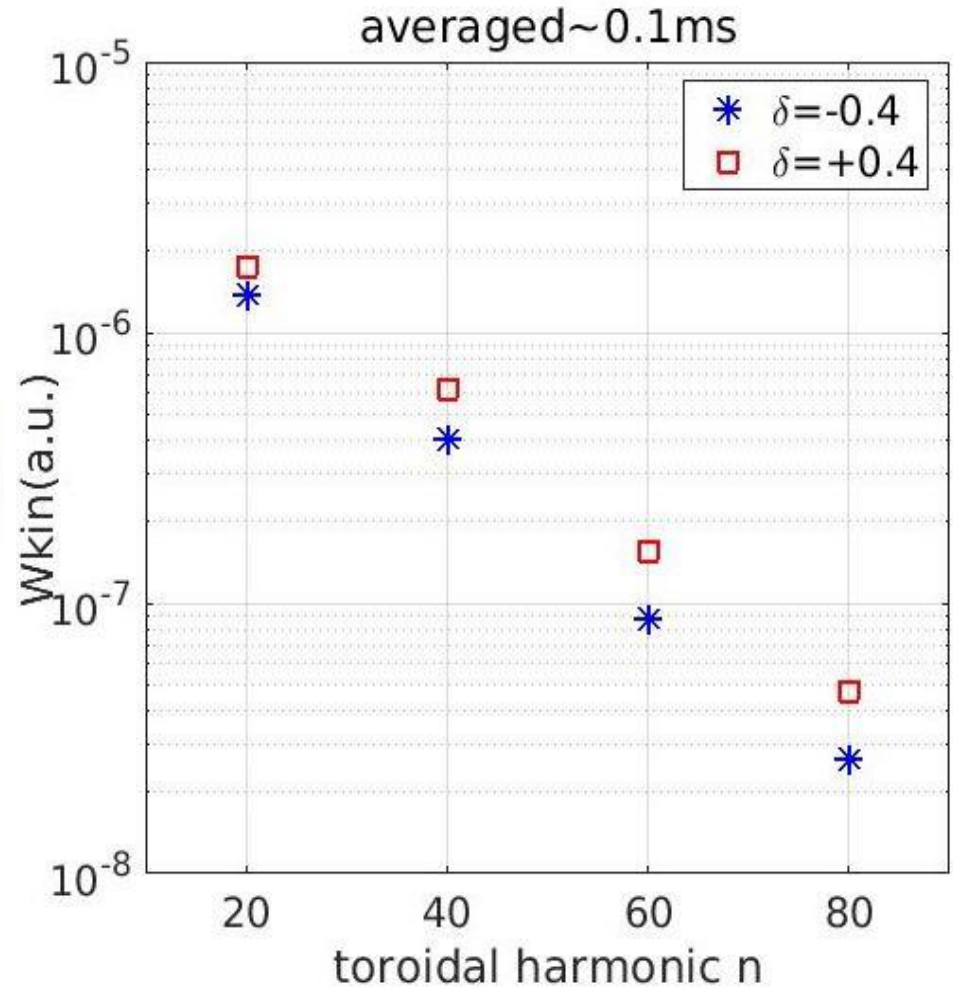

**Multi-harmonics N=20:80 ITG/TEM non-linear modelling.
 Initial phase (time<0.2ms) integrated $W_{kin,n,NT} < W_{kin,n,PT}$.
 But similar in non-linear phase (time>0.2ms)**

Small beneficial effect of NT&PT is seen on the integrated over volume kinetic energy for harmonics in TEM/ITG turbulence.

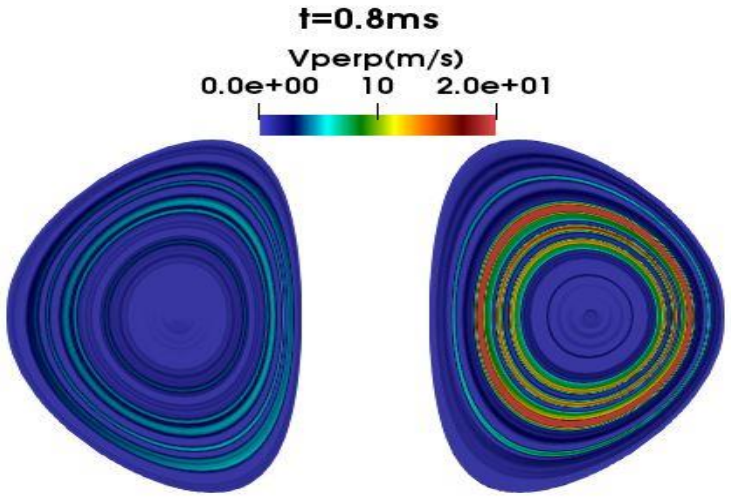

time=0.8ms

BUT! Poloidal zonal flow ($V_{\text{ExB}, \theta, N=0}$) in NT is larger compared to PT and perpendicular velocity ($V_{\text{ExB}, r, N=0}$) is smaller.

PT

NT

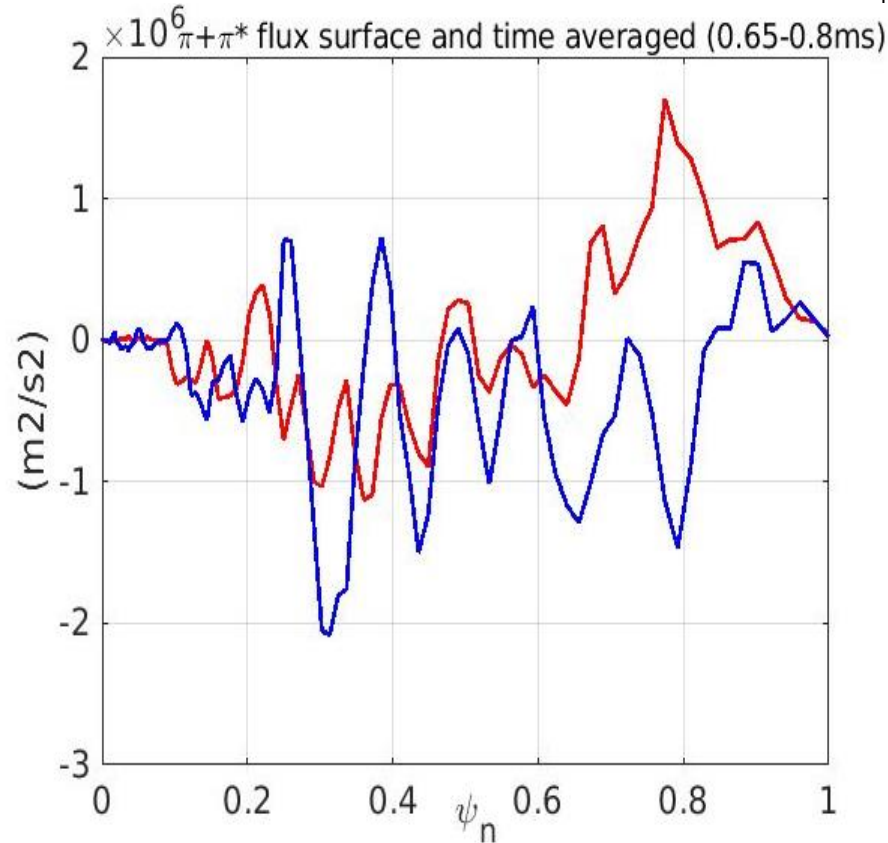

Reynolds stress tensor = source of zonal flows ? =>not clear if NT is better

$$\bar{\bar{R}} = (\bar{\vec{V}} \otimes \bar{\vec{V}}) \approx \pi + \pi^*$$

$$\pi = \langle \tilde{V}_{r,E} \tilde{V}_{\theta,E} \rangle; \quad \pi^* = \langle \tilde{V}_r^* \tilde{V}_{\theta,E} \rangle$$

$$\vec{V}_{i_\perp} = \vec{V}_E + \vec{V}_i^* \approx -(R^2 / F_0) (\nabla U \times \nabla \phi) - \delta^* (R^2 / \rho) (\nabla P_i \times \nabla \phi)$$

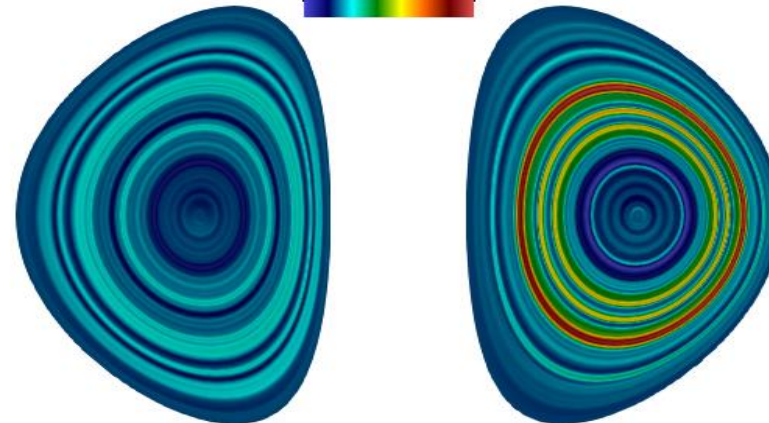

$$\hat{e}_r = \frac{\nabla \psi}{|\nabla \psi|} \quad \hat{e}_\theta = \frac{1}{|\nabla \psi| |\nabla \phi|} \nabla \psi \times \nabla \phi = \frac{R}{|\nabla \psi|} \nabla \psi \times \nabla \phi; \quad |\nabla \phi| = \frac{1}{R}$$

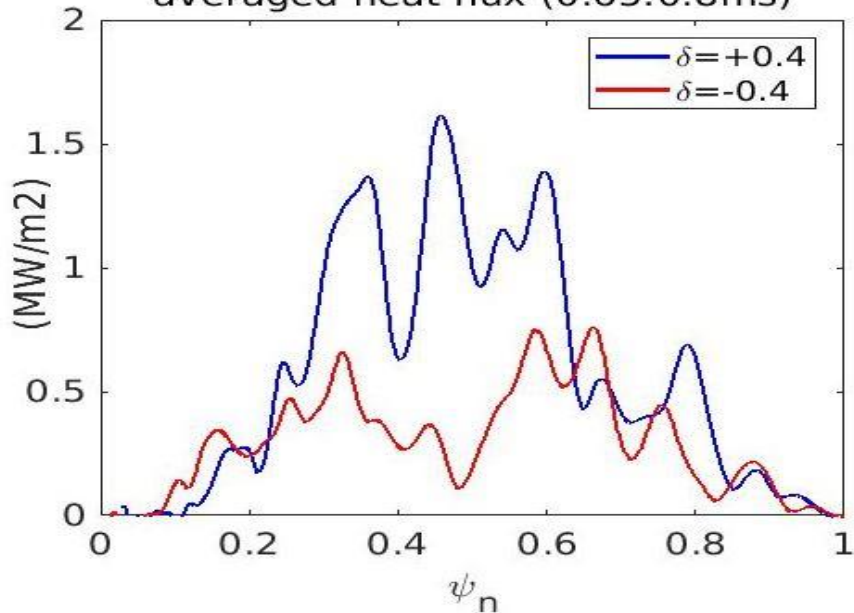

Density fluctuations are reduced in NT compared to PT.

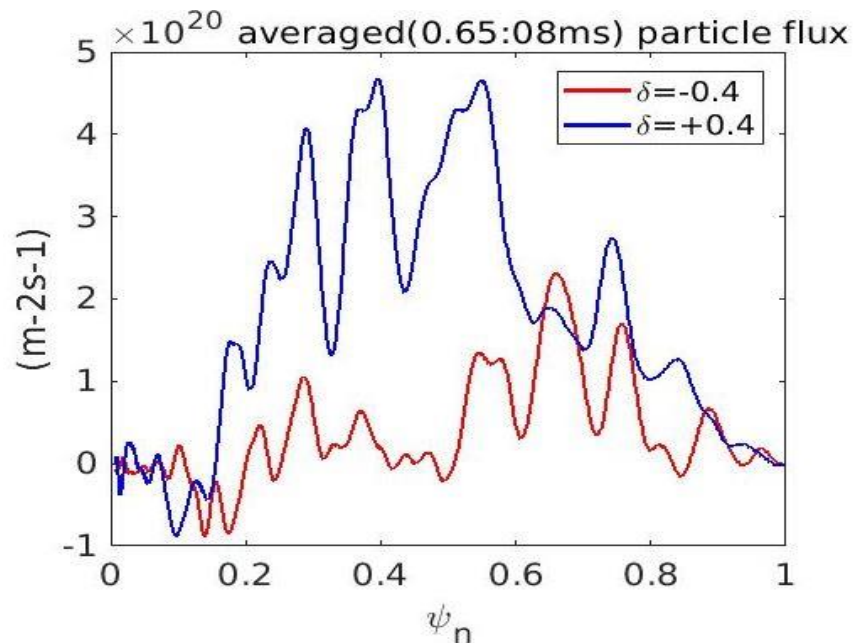

Perpendicular heat and particle fluxes are (up to factor ~2) smaller for NT than for PT.

averaged heat flux (0.65:0.8ms)

averaged(0.65:08ms) particle flux

Conclusions

- 1. Particles in JOREK code for global non-linear turbulence modelling in realistic X-point geometry: gyro-kinetic ions+ adiabatic or kinetic electrons. ITGs, ITG/TEMs were modelled in 3D ergodic fields with RMPs and at negative/positive triangularity shaping.**
- 2. ITGs with adiabatic electrons in H-mode (HL2A#36872) with RMPs. Comparison with experiment : frequency range and shape of spectra are similar in JOREK gyro-kinetic modelling. Stabilizing effect of mean ExB flow in pedestal.**
- 3. ITG and ITG/TEMs in L-mode (COMPASS #8078) with RMPs. Larger turbulence ITG/TEMs with kinetic electrons than only ITGs with adiabatic electrons. Increased turbulence with RMPs. Toroidal asymmetry of turbulence with RMP.**
- 4. Smaller (up to factor ~2) perpendicular heat and particle fluxes due to TEM/ITG turbulence in negative triangularity plasma shape compared to positive triangularity.**
