HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Porous scintillators for radioactive gas detection

R.Marie-Luce², P.Mai¹, F.Lerouge², Y.Cheret^{1,2}, S.Pierre³, B.Sabot³,
F.Chaput², and C. Dujardin^{1,4,*}

Context: detection of particular radioactive gases

It exists various kinds of radioactivities

| Type | Nuclear equation | Representation | Change in mass/atomic numbers |
|-------------------|---|--|--------------------------------------|
| Alpha decay | ${}_{Z}^{A}X \rightarrow {}_{Z-2}^{A-4}He + {}_{Z-2}^{A-4}Y$ |  | A: decrease by 4 Z: decrease by 2 |
| Beta decay | ${}_{Z}^{A}X \rightarrow {}_{Z-1}^{A}e + {}_{Z+1}^{A}Y$ |  | A: unchanged Z: increase by 1 |
| Gamma decay | ${}_{Z}^{A}X \rightarrow {}_{Z}^{A}\gamma$ |  Excited nuclear state | A: unchanged Z: unchanged |
| Positron emission | ${}_{Z}^{A}X \rightarrow {}_{Z+1}^{A}e + {}_{Z-1}^{A}Y$ |  | A: unchanged Z: decrease by 1 |
| Electron capture | ${}_{Z}^{A}X + {}_{-1}^{0}e \rightarrow {}_{Z-1}^{A}Y + \text{X-ray}$ |  | A: unchanged Z: decrease by 1 |

Context: γ -ray emitters

A common situation: as an illustration ^{137}Cs

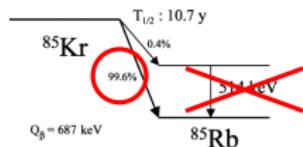

Here, it is easy to detect the γ with mature technologies
(even from far since γ -rays can travel in air)

Context: case of pure β -ray emitters

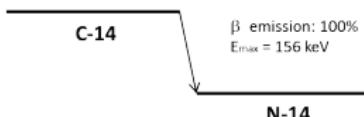

But in some cases

High probability toward
the ground state

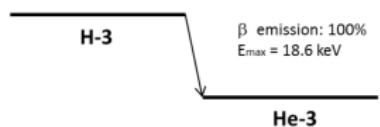

→ Almost no γ -rays

Only a ground state

→ no γ -rays

Only a ground state

→ no γ -rays

Here, no γ -rays → need to detect the β (electron)

(these 3 are really critical for the survey of nuclear power plants)

Context: societal impact

For production (case of various reactor technologies)

Table 6.3 Annual release of radionuclides (per GWe of electricity generation) from nuclear reactors (based on the data reported for the 1990–1994 period) (data source: UNSCEAR 2000)

| | Normalized release per GWe of electricity generation (TBq per GWe per year) | | | | |
|---|---|------|------|---|--|
| | Airborne Release | | | Liquid Release | |
| Noble gas (¹³³ Xe, ¹³⁵ Xe, ⁸⁵ Kr) | | | | Particulates (mostly as ⁸⁸ Rb, ⁸⁹ Rb, ¹³⁹ Ba) | Other (⁹⁰ Sr, ¹³⁷ Cs, ⁵¹ Cr, ⁵⁴ Mn, ⁵⁸ Co, ⁶⁰ Co, and ⁹⁵ Zr) |
| PWR | 27 | 2.3 | 0.22 | 0.0003 | 0.0002 |
| BWR | 350 | 0.94 | 0.51 | 0.0008 | 0.18 |
| GCR | 1600 | 4.7 | 1.4 | 0.0014 | 0.0003 |
| HWR | 2100 | 650 | 1.6 | 0.0004 | 0.00005 |
| LWGR | 1700 | 26 | 1.3 | 0.007 | 0.014 |
| FBR | 380 | 49 | 0.12 | 0.0003 | 0.012 |
| Total | 330 | 36 | 0.44 | 0.0007 | 0.040 |
| Total combined release: 415 (TBq) | | | | | |

For reprocessing of nuclear fuel

Table 6.4 Annual average release of radioactivity from reprocessing (as release in TBq per GWe of electricity generation during the period 1990–1994) (data source: UNSCEAR 2000)

| | Airborne release | Liquid release |
|-------------------|--------------------|----------------|
| ³ H | 24 | 270 |
| ¹⁴ C | 0.4 | 0.8 |
| ⁸⁵ Kr | 6300 | — |
| ⁹⁰ Sr | — | 2.0 |
| ¹⁰⁶ Ru | — | 2.1 |
| ¹²⁹ I | 0.001 | 0.03 |
| ¹³¹ I | 9×10^{-5} | — |
| ¹³⁷ Cs | 8×10^{-5} | 1.03 |

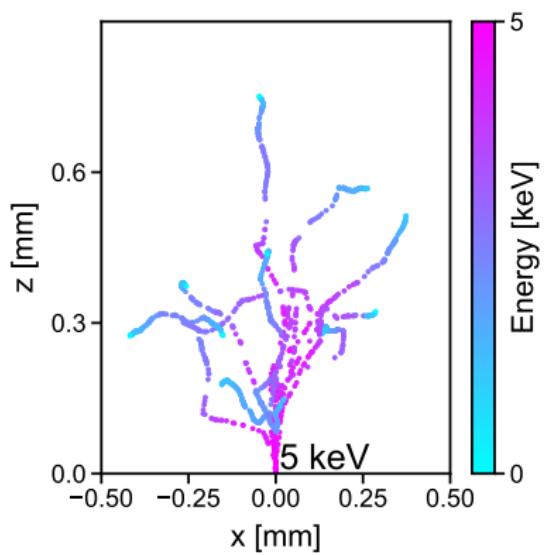

Yim M.S. Generation of nuclear Waste from Nuclear Power, (Springer) Netherlands, Dordrecht, 2022

→ Need for an efficient and real-time detector for these ones

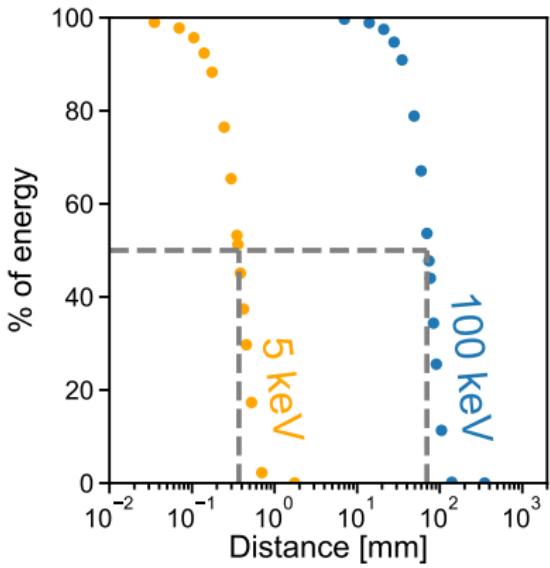

Context: very short penetration in air

But

Simulated trajectories of 5 keV electrons in air

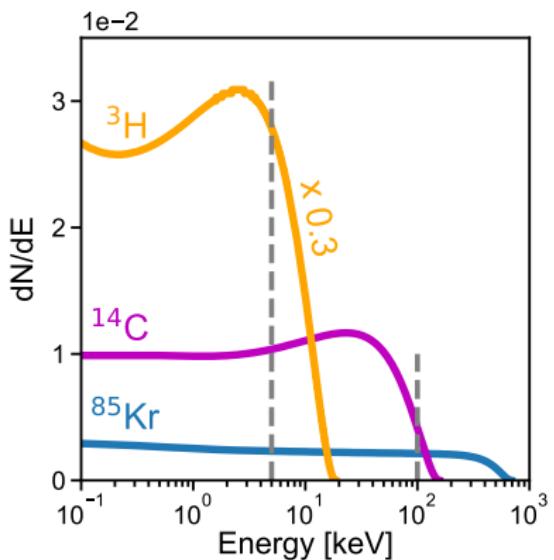

Remaining energy at various distances from the initial point.

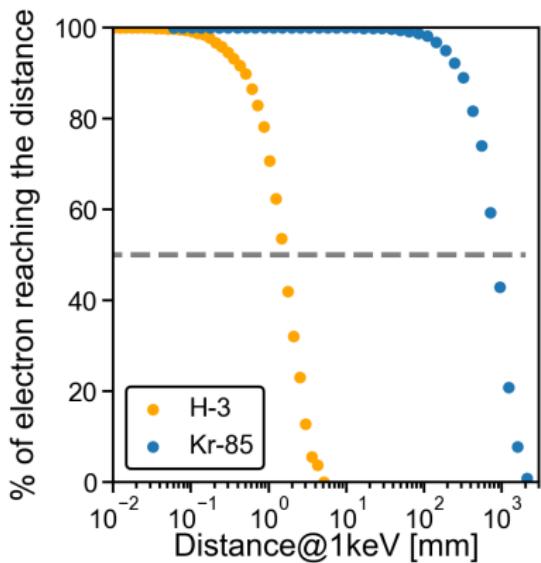

Context: very short penetration in air

calculations for 3H and ^{85}Kr

Simulated energy distributions

Efficiency of detection (1 keV limit)

→ the ideal detection system needs to mix the gaz with the sensor !

Context

→ the element to be detected has to be intermixed with the sensor

gaz - liquid mixing

bubbling the gaz in liquid
scintilllator

- \approx 1 week for 1 measurement
- only for 3H
- organic wastes

Context

→ the element to be detected has to be intermixed with the sensor

gaz - liquid mixing

bubbling the gaz in liquid
scintilllator

gaz - gaz mixing

proportionnel counter

- ≈ 1 week for 1 measurement
- only for 3H
- organic wastes

- ≈ 150 k€
- requires a carrier gaz
- fragile and sensitive electronics

→ can we do better with gaz-solid mixing approach?

Material science strategy for gaz-solid mixing

The concept of porous scintillator: the scintillating sponge

Material science strategy for gaz-solid mixing

Main requirements: a few cm sizes, transparent, bright and fast

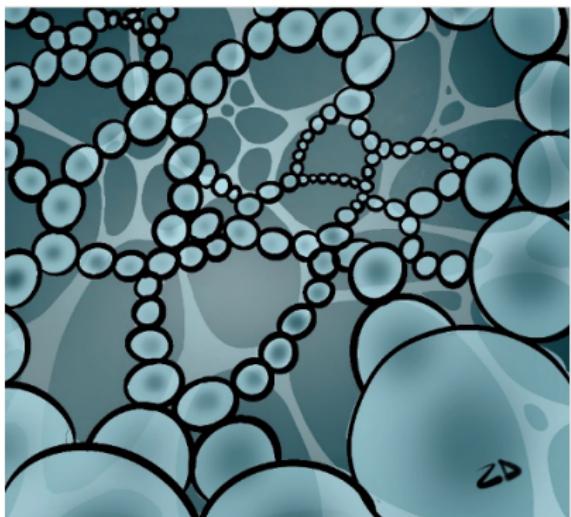

Material science strategy for gaz-solid mixing

transparent = nano-sized architecture

Aerogel of silica

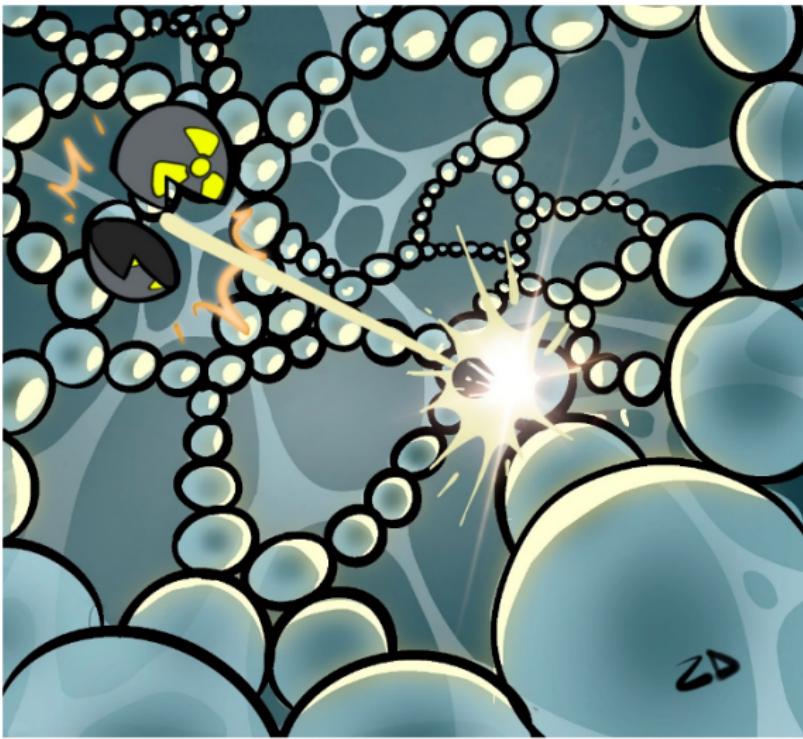

network of nanoparticles

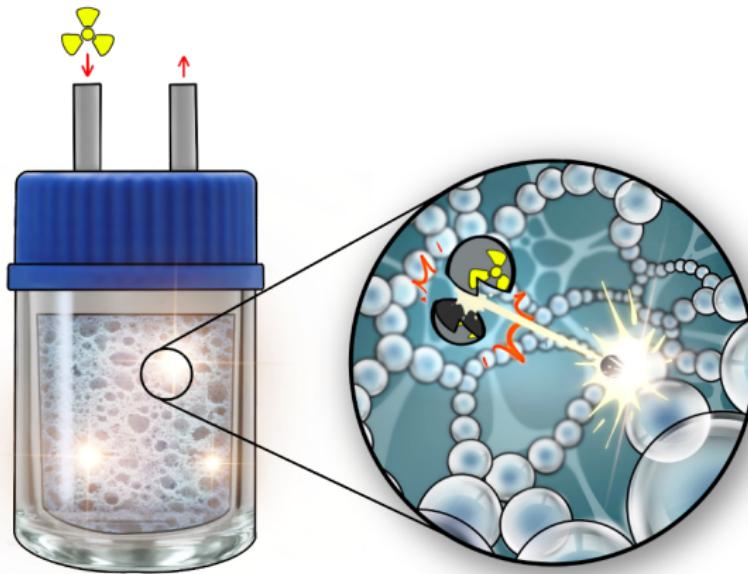

Material science strategy for gaz-solid mixing

bright and fast: an aerogel of **inorganic nanoscintillators or MOF**

Material science strategy for gaz-solid mixing

The concept and target ($h \approx 5 \text{ cm}$, $\varnothing \approx 2.5\text{cm}$)

Detection of Radioactive Gas with Scintillating MOFs

*Sharvanee Mauree, Vincent Villemot, Matthieu Hamel, Benoit Sabot, Sylvie Pierre, Christophe Dujardin, Francesca Belloni, Angiolina Comotti, Silvia Bracco, Jacopo Perego, and Guillaume H. V. Bertrand**

It performs well as building block: bright and fast (organic dyes)
but hard to get a transparent monolith yet.

Aerogel of inorganic nanoscintillator

It exists many compositions satisfying the needs:
 CeBr_3 , $\text{Y}_2\text{SiO}_5:\text{Ce}^{3+}$, $\text{Y}_3\text{Al}_5\text{O}_{12}:\text{Ce}^{3+}$, ...

but:

- It requires to prepare a large porous aerogel (a few cm)
- Chemical stability
- Radiopure (no Lu)
- With properties as nanosize preserved
- We do not care about density of the compound

→ based on our experience, we have selected $\text{Y}_3\text{Al}_5\text{O}_{12}:\text{Ce}^{3\text{or}4+}$

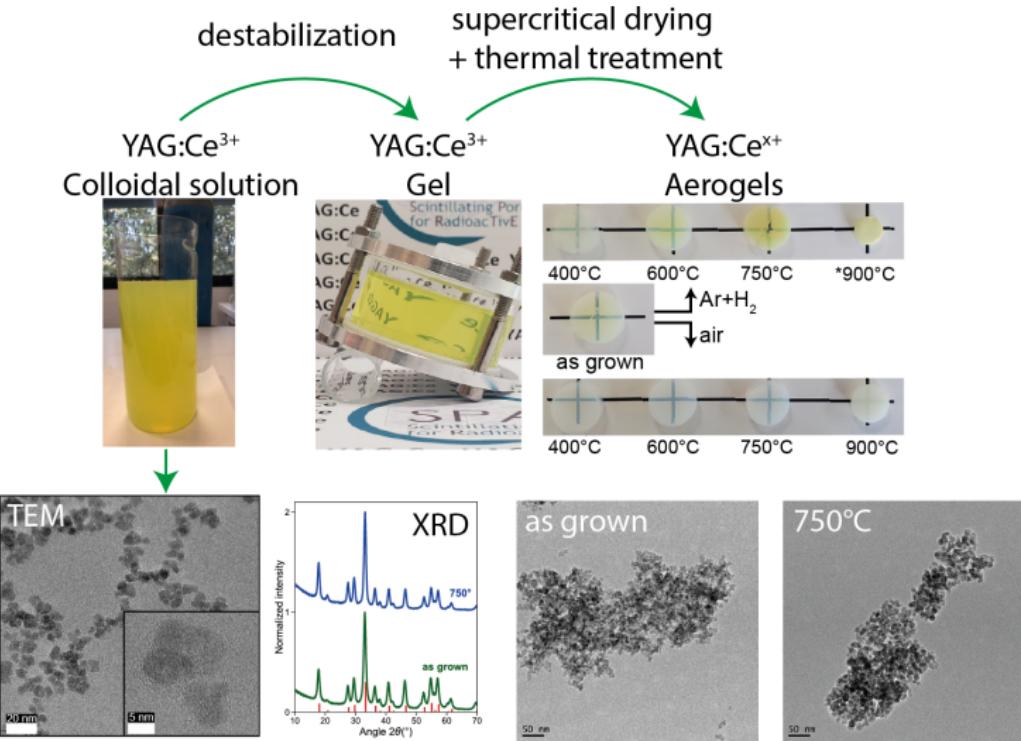

From Nanoparticle Assembly to Monolithic Aerogels of YAG, Rare Earth Fluorides, and Composites

Mateusz Odziomek,^{†,‡} Frederic Chaput,^{§,†} Frederic Lerouge,[†] Christophe Dujardin,^{§,¶} Maciej Sitarz,[‡] Silvia Karpati,[†] and Stephane Parola^{¶,†}

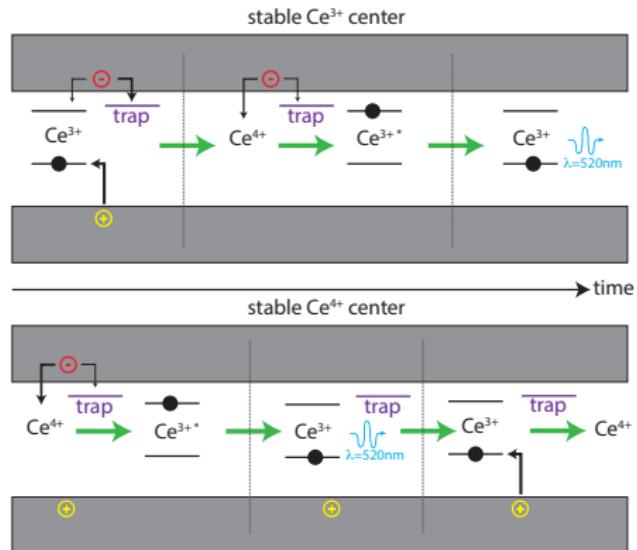

Aerogel of YAG:Ce⁴⁺

From a lab sample to a functional sensor (with YAG:Ce⁴⁺)

The Scintillation of the YAG:Ce⁴⁺ aerogel

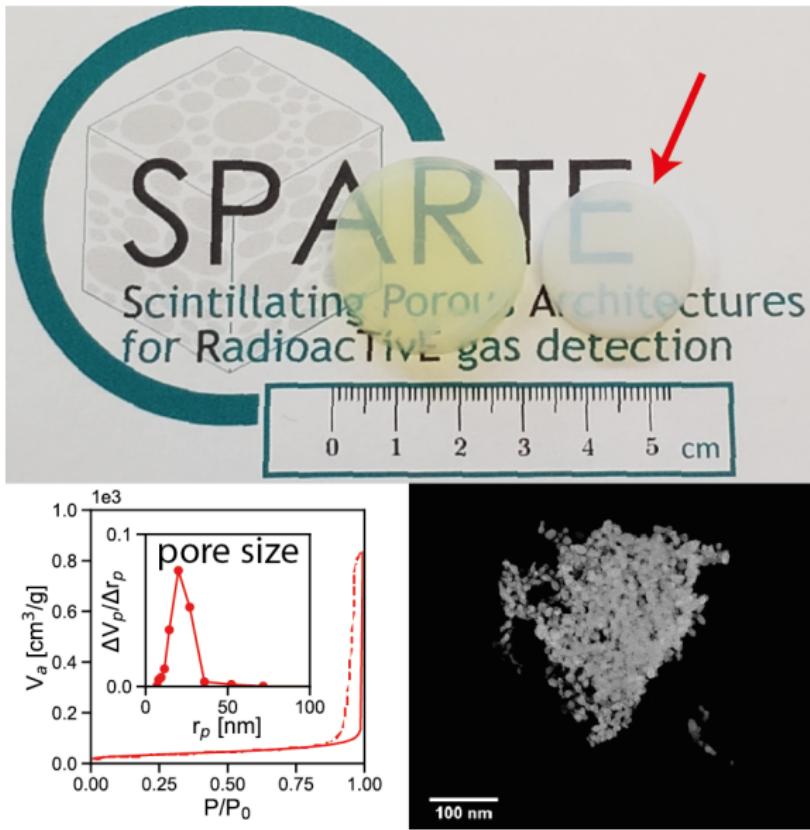

→ **4+ is not a typo:** we are dealing with scintillation!
Ce⁴⁺ can be seen as a "pre-prepared" Ce³⁺ + 1 captured hole.

See

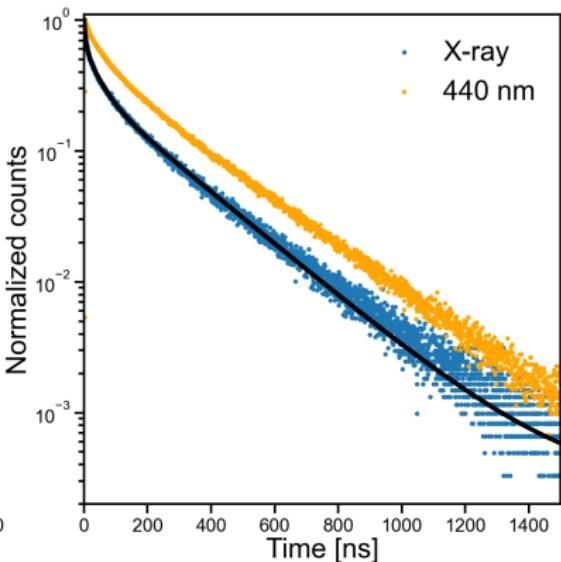

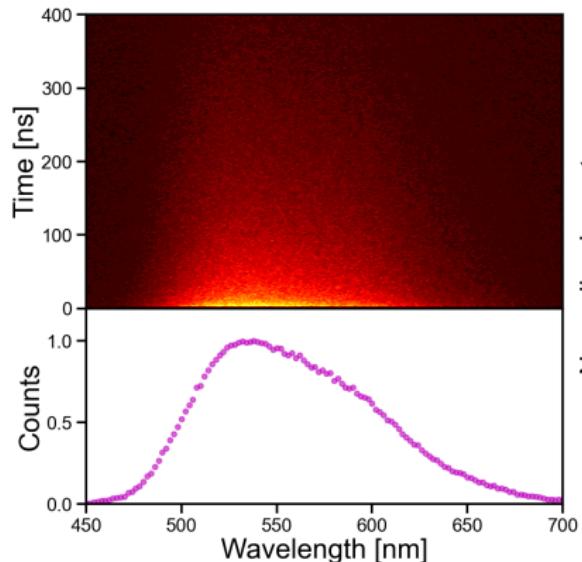

- Blahuta et. al. IEEE-TNS2013 for LYSO:Ce
- Nikl et. al. Cryst. Growth and Des. 2014 with LuAG:Ce
- Dujardin et.al. IEEE-TNS 2018 as a review

The selected YAG:Ce⁴⁺ aerogel sample

The Scintillation of the YAG:Ce⁴⁺ aerogel

Radioluminescence spectra and time response under X-rays

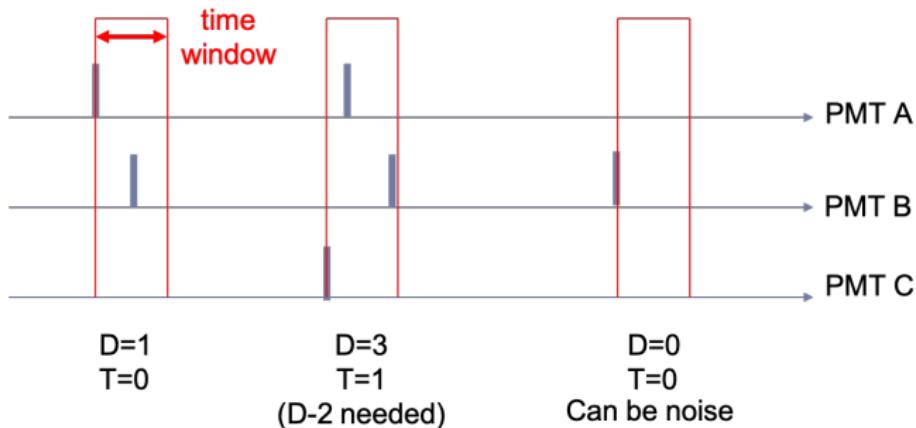

Standard RL spectra for YAG:Ce⁴⁺
Slower decay due to the low refractive index
 $d \approx 0.36 \text{ g.cm}^{-3}$ (crystal $d=4.56\text{g.cm}^{-3}$) → **92% of air, 8% of YAG**

Measuring the yield of aerogel

3 PMTs: Double and triple coincidence technique

A scintillation event → several optical photons

- for this scheme each pulse corresponds to a single **optical** photon

→ D=1 : 1 scintillation event → D gives the activity

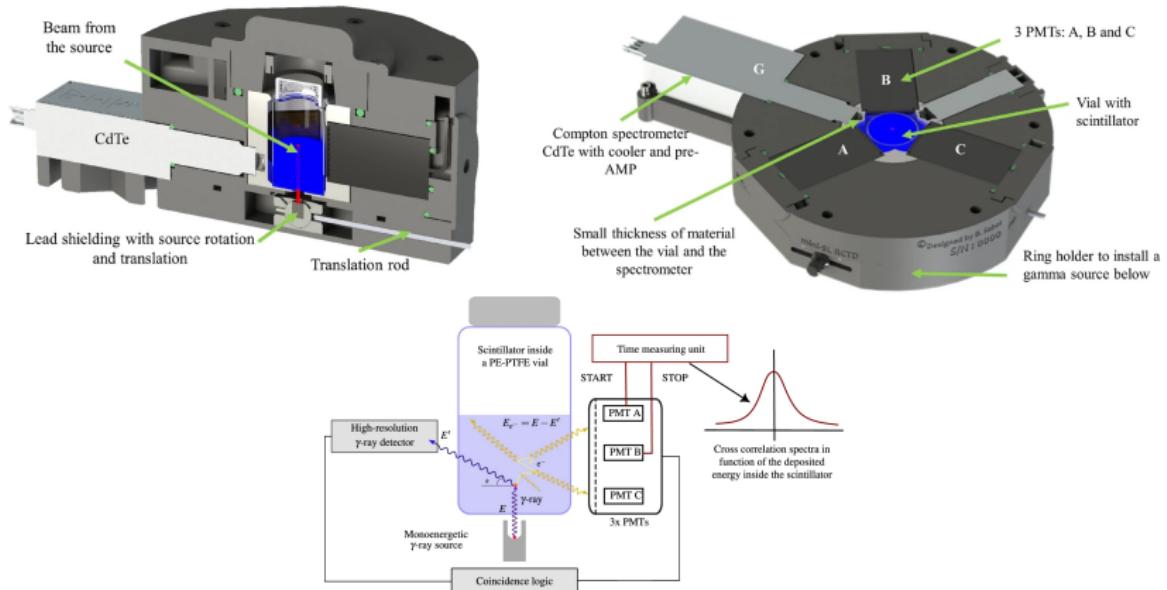

→ T/D gives the scintillation yield

According to Poisson distribution $n_{pe} \approx -3\ln(1 - \frac{T}{D})$

see: Broda R., Cassette P. and Kossert K. 2007: Radionuclide metrology using liquid scintillation counting; Metrologia 44 (2007) 36-52

Measuring the yield of aerogel

The Compton TDCR experiment

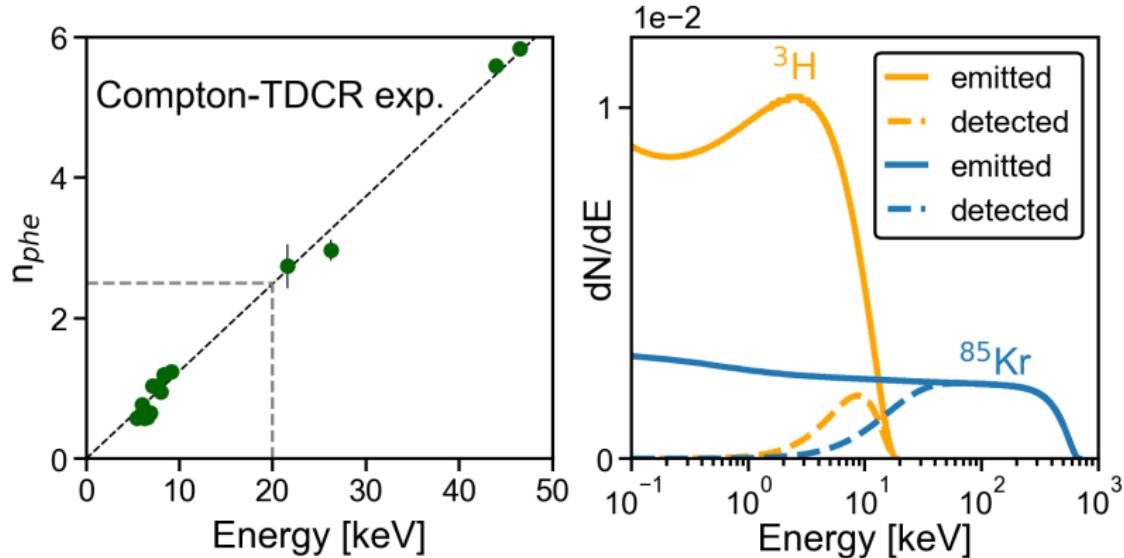

→ It allows to know the yield at known electron energy

see: Sabot B.. 2024, Scientific Report 14, 6960

Measuring the yield of aerogel

Efficiency under electron excitation

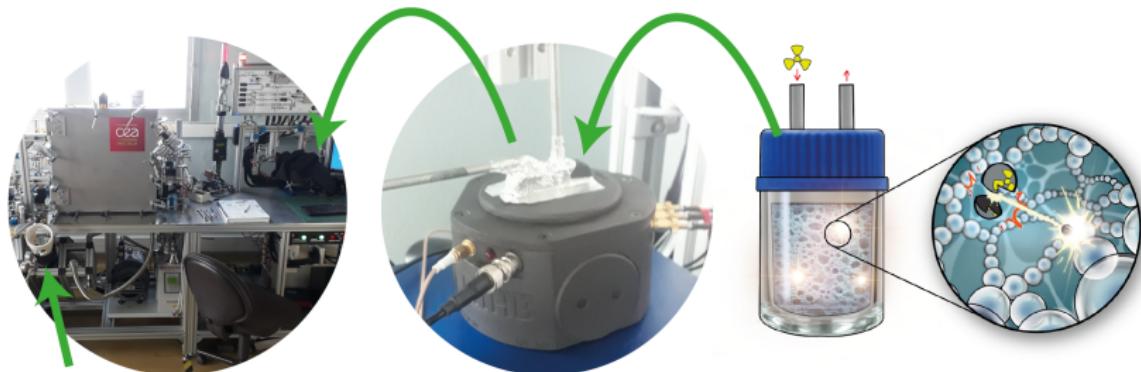

Compton-TDCR $\rightarrow 0.124 \text{ phe/keV}$

$0.124 \text{ phe/keV} \rightarrow$ detection efficiency prediction:
96.3% for ^{85}Kr and 17.6% for 3H

The Experiment under radioactive Gaz

The detection module with 3 PMTs developed for Liquid Scintillation at CEA-LNHB

→ Double and triple coincidences technique

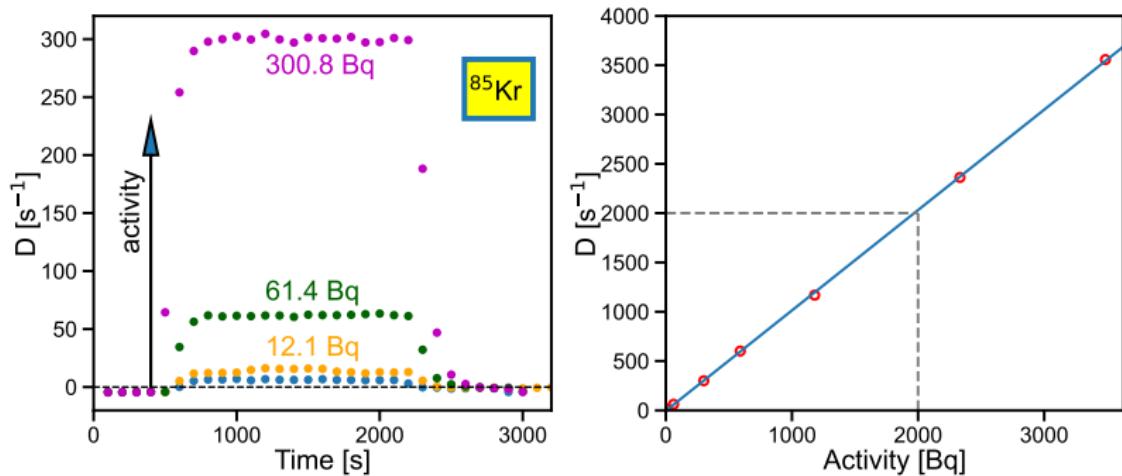

The radioactive gas

3 aerogel pieces in the liquid scintillation vial were used.

The results with ^{85}Kr

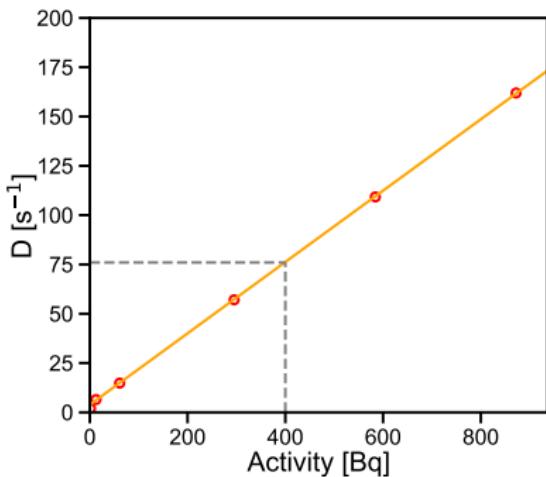

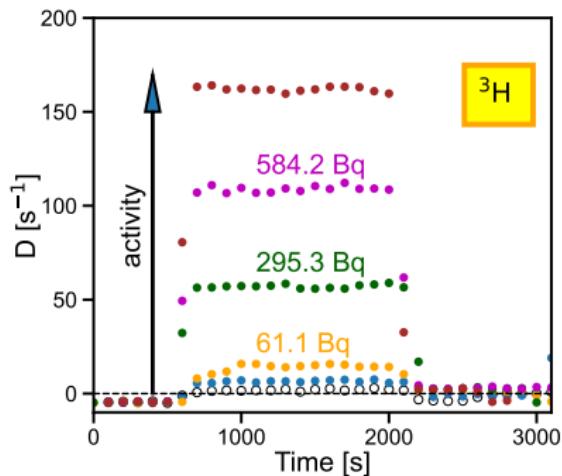

Analysis in 100s per point (almost real time)

Very good linearity for ^{85}Kr and 100% of detection efficiency !
(96.3% was predicted)

The results with 3H

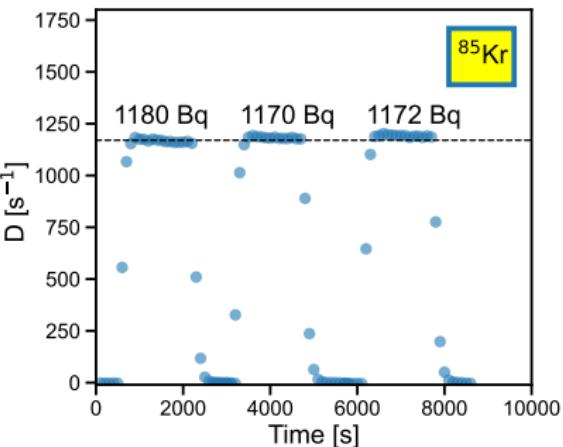

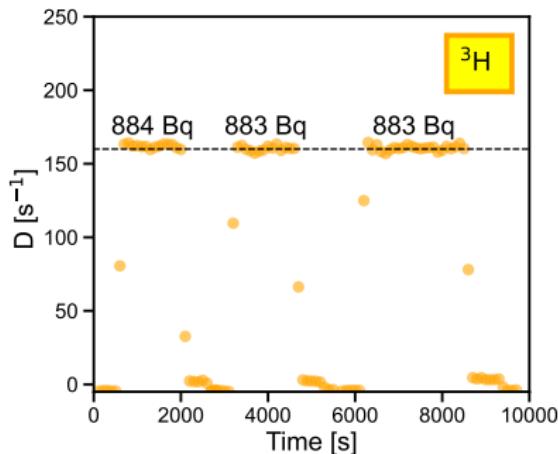

Analysis in 100s per point (almost real time)

Very good linearity for 3H and 18.1% of detection efficiency !
(17.6% was predicted)

Multiple measurements

And a good detection reproducibility

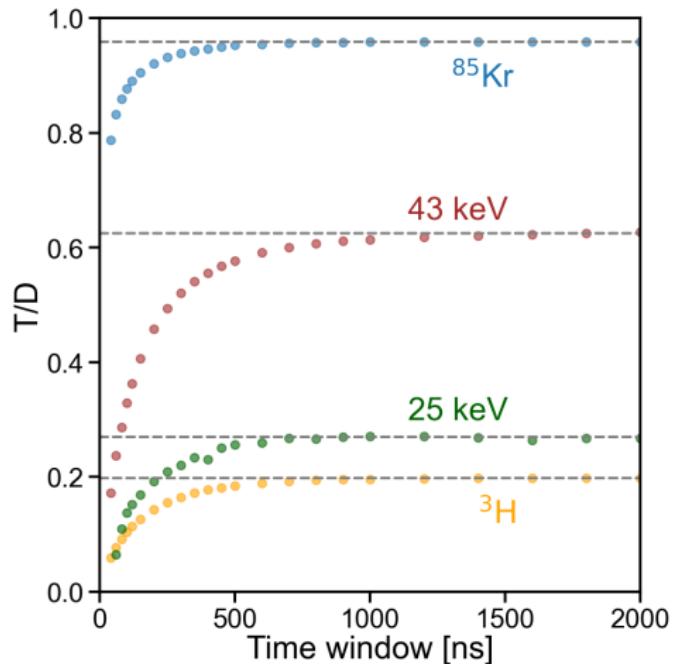

We can detect sub-Bq / cm³ of ⁸⁵Kr & ³H in real time!

Current detection sensitivity: a few 10mBq/cm³ (atm. pressure)

About Time coincidence window

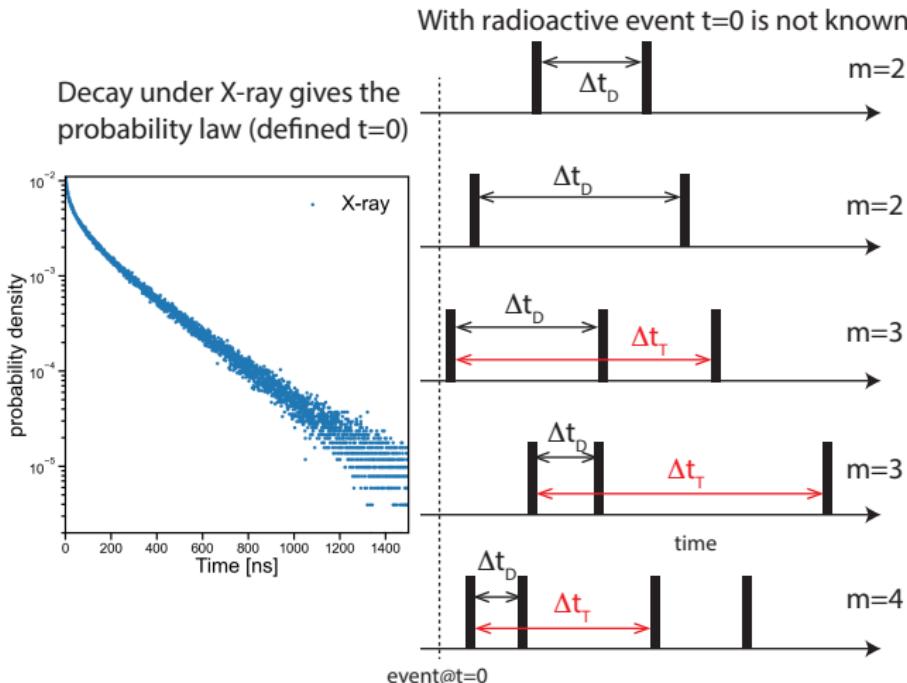

Experimental evolution of T/D as a function of Δt

Can we simulate?

About Time coincidence window

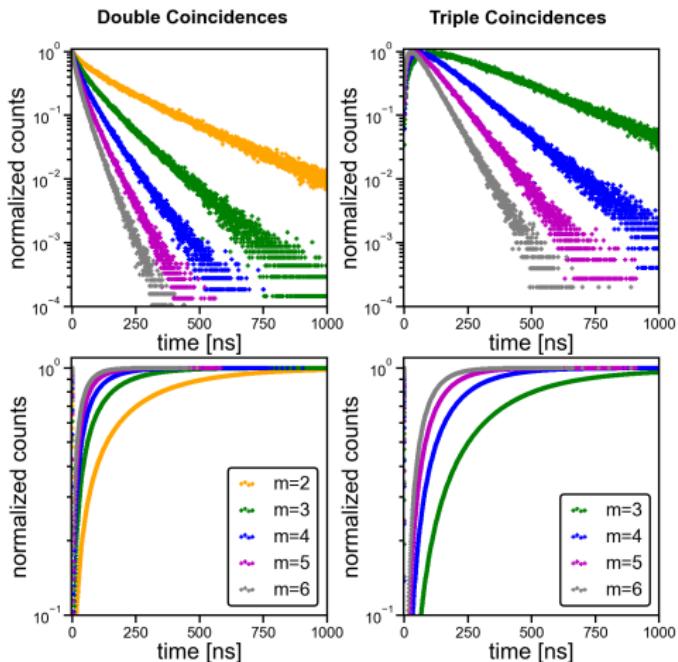

The Monte Carlo method with the X-ray decay

→ It allows to evaluate D and T vs Δt for various m.

About Time coincidence window

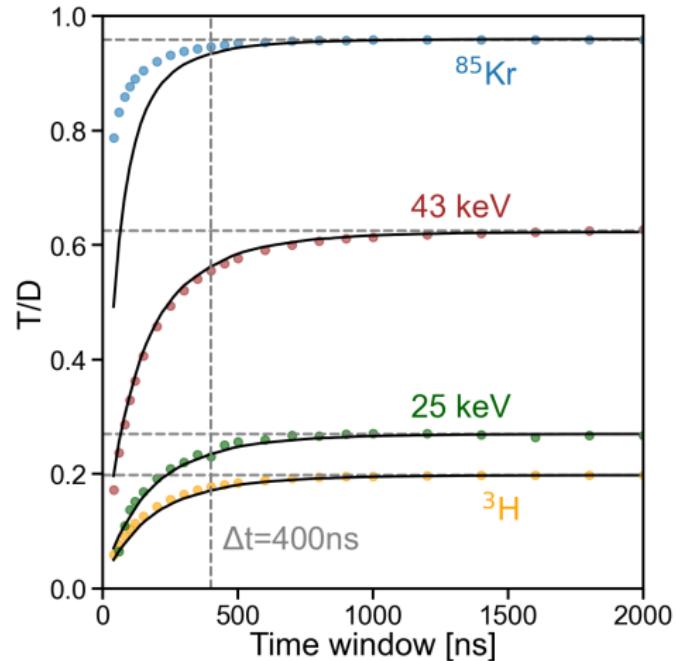

The Monte Carlo method to simulate T and D vs Δt

→ let's take a poisson distribution to get T/D vs Δt ?

About Time coincidence window

Experience & simulation of T/D vs Δt

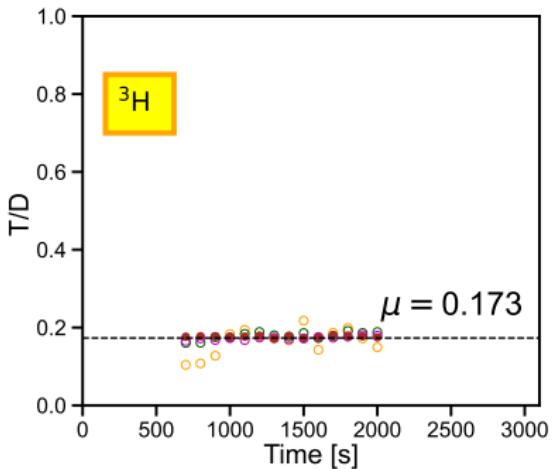

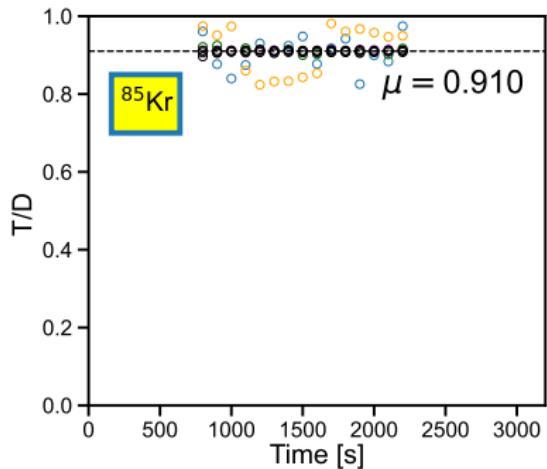

- $\Delta t = 400\text{ ns}$ is a good compromise: signal / noise
- Cannot fit the ^{85}Kr because of the wide spectrum

Spectroscopic capability

Analysis of the ratio triple coinc. / double coinc.

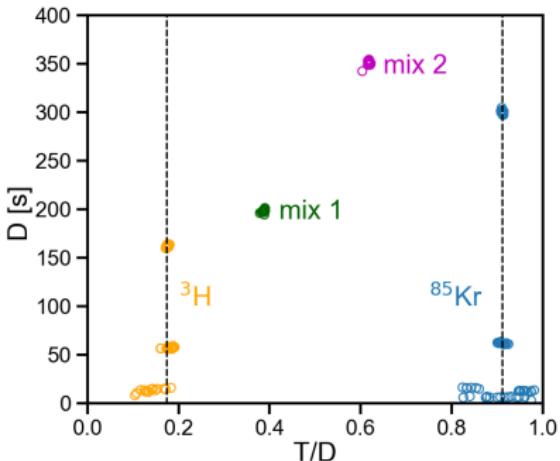

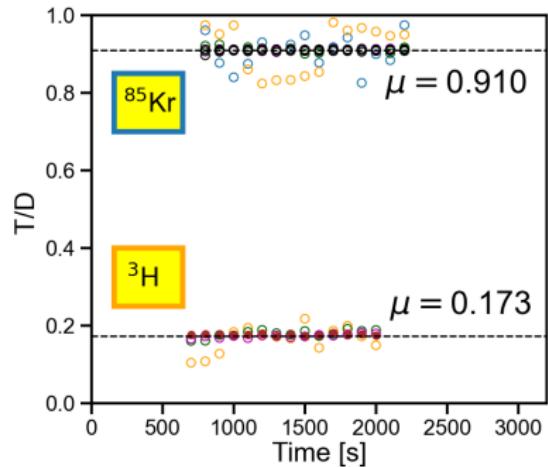

(an indicator of the mean number of photons per event)

It reflects the higher mean energy of electrons for ^{85}Kr
→ It can be used for gaz identification

Spectroscopic capability

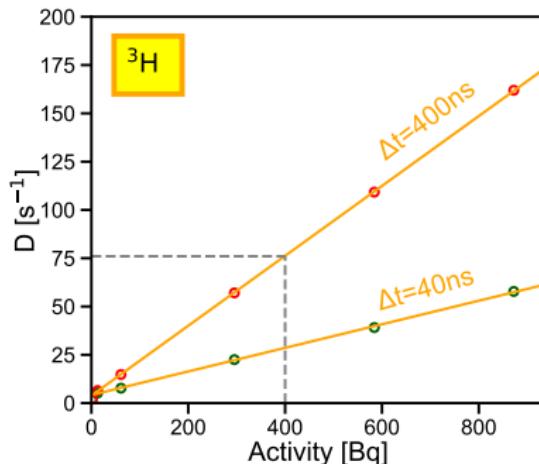

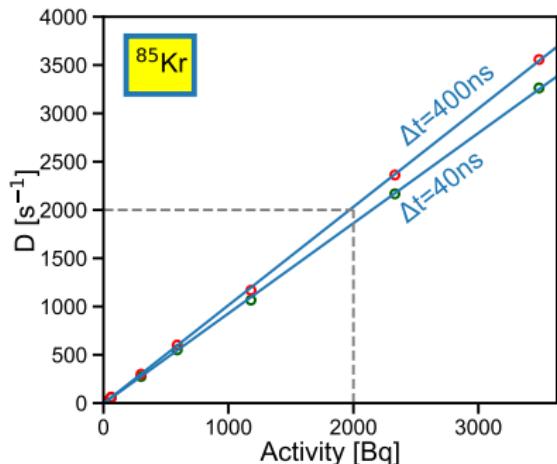

A measure with 2 gaz mixtures (${}^3\text{H}$ + ${}^{85}\text{Kr}$)

→ The mixtures can be identified !
(but requires a system with 3 detectors)

Spectroscopic capability

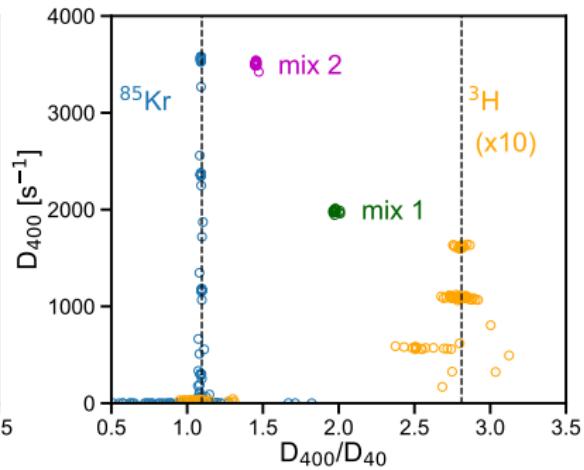

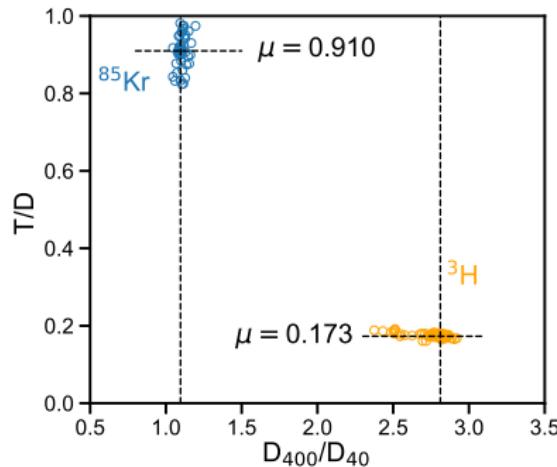

The same information considering D with 2 different time windows

- large electron energy: almost no difference
- small electron energy: large difference
- It can be obtained with only 2 detectors!

Spectroscopic capability

Identification with the 2D map: Activity (D_{400}) vs D_{400}/D_{40}

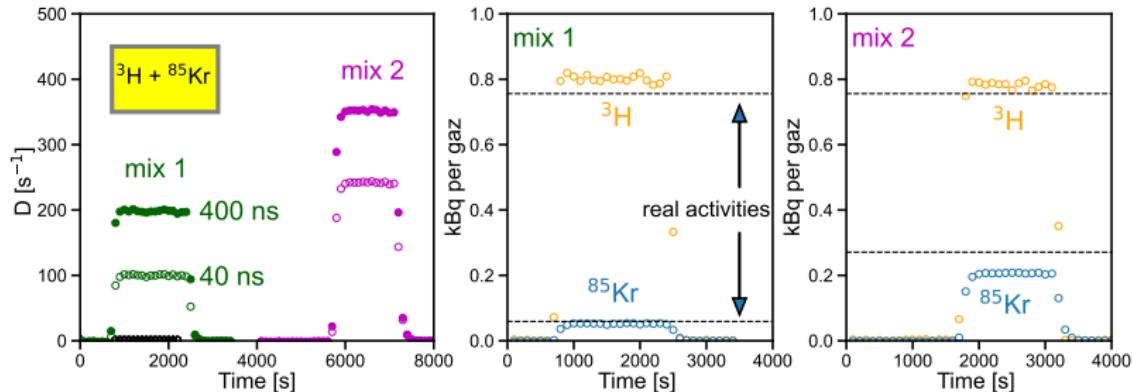

→ It allows to check the "purity" of the gases as well !

→ Measurement with the same gas mixtures ($^{85}\text{Kr} + ^3\text{H}$)

Spectroscopic capability

Example of measurements with the 2 gas mixtures ($^{85}\text{Kr} + ^3\text{H}$)

We can combine the 2 informations to "demix" the respective activities
→ Almost real time information (100 s per point)
- Patent 2307880 (July 2023) -

→ Crucial information for nuclear power plants during operation

Conclusion

Thank you for your attention
